# Relaxation results for a class of functionals with linear growth defined on manifold constrained mappings 

Mariano Giaquinta and Domenico Mucci

#### Abstract

In this paper we study the lower semicontinuous envelope of a class of functionals with linear growth defined on mappings from the $n$-dimensional ball into $\mathbb{R}^{N}$ that are constrained to take values into a smooth submanifold $\mathcal{Y}$ of $\mathbb{R}^{N}$.

Let $B^{n}$ be the unit ball in $\mathbb{R}^{n}$ and $\mathcal{Y}$ a smooth oriented Riemannian manifold of dimension $M \geq 1$, isometrically embedded in $\mathbb{R}^{N}$ for some $N \geq 2$. We shall assume that $\mathcal{Y}$ is compact, connected, without boundary. In addition, we assume that the integral 1-homology group $H_{1}(\mathcal{Y}):=H_{1}(\mathcal{Y} ; \mathbb{Z})$ has no torsion.

In this paper we shall be concerned with manifold constrained energy relaxation problems, and we consider variational functionals $\mathcal{F}: L^{1}\left(B^{n}, \mathcal{Y}\right) \rightarrow[0,+\infty]$ of the type

$$
\mathcal{F}(u):= \begin{cases}\int_{B^{n}} f(x, u, D u) d x & \text { if } u \in C^{1}\left(B^{n}, \mathcal{Y}\right)  \tag{0.1}\\ +\infty & \text { otherwise }\end{cases}
$$

for a suitable class of integrands $f: B^{n} \times \mathbb{R}^{N} \times M(N, n) \rightarrow[0,+\infty)$, where $M(N, n)$ is the class of real $(N \times n)$-matrices and, for $X=C^{1}, L^{1}, B V, W^{1,1}$,

$$
X\left(B^{n}, \mathcal{Y}\right):=\left\{u \in X\left(B^{n}, \mathbb{R}^{N}\right) \mid u(x) \in \mathcal{Y} \quad \text { for } \quad \mathcal{L}^{n} \text {-a.e. } x \in B^{n}\right\}
$$

We introduce the relaxed functional $\overline{\mathcal{F}}: L^{1}\left(B^{n}, \mathcal{Y}\right) \rightarrow[0,+\infty]$ defined for every function $u \in L^{1}\left(B^{n}, \mathcal{Y}\right)$ by

$$
\begin{array}{r}
\overline{\mathcal{F}}(u):=\inf \left\{\liminf _{k \rightarrow \infty} \mathcal{F}\left(u_{k}\right) \mid\left\{u_{k}\right\} \subset C^{1}\left(B^{n}, \mathcal{Y}\right),\right.  \tag{0.2}\\
\left.u_{k} \rightarrow u \text { strongly in } L^{1}\left(B^{n}, \mathbb{R}^{N}\right)\right\} .
\end{array}
$$

We restrict our analysis to the class of integrands $f$ given by

$$
f(x, u, D u):=\widetilde{f}\left(x, u,\left(\left|D u^{1}\right|, \ldots,\left|D u^{N}\right|\right)\right)
$$

for some function $\tilde{f}: B^{n} \times \mathbb{R}^{N} \times \mathbb{R}_{+}^{N} \rightarrow \mathbb{R}_{+}$, where $\mathbb{R}_{+}:=[0,+\infty)$, satisfying the following properties:
(a) $z \mapsto \widetilde{f}(x, u, z)$ is convex and lower semicontinuous in $\mathbb{R}_{+}^{N}$ for every $(x, u) \in B^{n} \times \mathbb{R}^{N}$;
(b) $C_{1}|z| \leq \widetilde{f}(x, u, z) \leq C_{2}(1+|z|)$ for every $(x, u, z) \in B^{n} \times \mathbb{R}^{N} \times \mathbb{R}_{+}^{N}$ and some absolute constants $C_{i}>0$;
(c) for every $u \in \mathbb{R}^{N}$ there exists a continuous function $\omega_{u}: \mathbb{R}_{+} \rightarrow \mathbb{R}_{+}$satisfying $\omega_{u}(t) \rightarrow 0$ if $t \rightarrow 0$, and depending continuously on $u \in \mathbb{R}^{N}$, such that

$$
\left|\widetilde{f}(x, u, z)-\widetilde{f}\left(x_{0}, u, z\right)\right| \leq \omega_{u}\left(x-x_{0}\right) \cdot(1+|z|) \quad \forall z \in \mathbb{R}_{+}^{N}
$$

Assuming that the first homotopy group $\pi_{1}(\mathcal{Y})$ is commutative, we will prove that

$$
\overline{\mathcal{F}}(u)<+\infty \quad \Longleftrightarrow \quad u \in B V\left(B^{n}, \mathcal{Y}\right)
$$

Moreover, we will show that

$$
\begin{equation*}
\overline{\mathcal{F}}(u)=\inf \left\{\mathcal{E}_{f}(T) \mid T \in \mathcal{T}_{u}^{1,1}\right\} \quad \forall u \in B V\left(B^{n}, \mathcal{Y}\right) . \tag{0.3}
\end{equation*}
$$

In this formula, $\mathcal{T}_{u}^{1,1}$ denotes the class of Cartesian currents $T$ in cart $^{1,1}\left(B^{n} \times \mathcal{Y}\right)$ such that the underlying $B V$-function $u_{T}$ is equal to $u$, according to ( 0.5 ), and $\mathcal{E}_{f}(T)$ a suitable $f$-energy on $T$.

To be more precise, see Sec. 3, we recall from [12] [13] that the class cart ${ }^{1,1}\left(B^{n} \times \mathcal{Y}\right)$ agrees with the currents that arise as weak limits of sequences $\left\{G_{u_{k}}\right\}$ of currents carried by the graphs of smooth maps $u_{k} \in C^{1}\left(B^{n}, \mathcal{Y}\right)$ with equibounded total variation energies,

$$
\begin{equation*}
\sup _{k} \int_{B^{n}}\left|D u_{k}\right| d x<\infty . \tag{0.4}
\end{equation*}
$$

The weak convergence $G_{u_{k}} \rightharpoonup T$, with the energy bound (0.4), yields the weak convergence $u_{k} \rightharpoonup u_{T}$ in the $B V$-sense to some function $u_{T} \in B V\left(B^{n}, \mathcal{Y}\right)$, i.e., $u_{k} \rightarrow u_{T}$ in $L^{1}\left(B^{n}, \mathbb{R}^{N}\right)$ and $D u_{k} \rightarrow D u_{T}$ weakly as vector-valued measures. This clearly yields that for every $T \in \operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$

$$
\begin{equation*}
T\left(\phi(x, y) d x^{1} \wedge \cdots \wedge d x^{n}\right)=\int_{B^{n}} \phi\left(x, u_{T}(x)\right) d x \quad \forall \phi \in C_{c}^{\infty}\left(B^{n} \times \mathcal{Y}\right) . \tag{0.5}
\end{equation*}
$$

We will define for every current $T$ in $\operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$ a suitable $f$-energy $\mathcal{E}_{f}(T)$ that is lower semicontinuous and satisfies a density property, see Sec. 4 and Sec. 5, that is, if $T_{k}, T \in \operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$ and $T_{k} \rightharpoonup T$, then we have

$$
\mathcal{E}_{f}(T) \leq \liminf _{k \rightarrow \infty} \mathcal{E}_{f}\left(T_{k}\right),
$$

and for every $T \in \operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$ we can find a sequence of smooth maps $\left\{u_{k}\right\} \subset C^{1}\left(B^{n}, \mathcal{Y}\right)$ such that $G_{u_{k}} \rightharpoonup T, u_{k} \rightharpoonup u_{T}$ weakly in the $B V$-sense, and

$$
\lim _{k \rightarrow \infty} \int_{B^{n}} f\left(x, u_{k}, D u_{k}\right) d x=\mathcal{E}_{f}(T) .
$$

These properties yield that the $f$-energy agrees with the relaxed energy of currents, i.e., for every $T \in$ $\operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$

$$
\mathcal{E}_{f}(T)=\inf \left\{\liminf _{k \rightarrow \infty} \int_{B^{n}} f\left(x, u_{k}, D u_{k}\right) d x \mid\left\{u_{k}\right\} \subset C^{1}\left(B^{n}, \mathcal{Y}\right), G_{u_{k}} \rightharpoonup T\right\},
$$

the weak convergence to be precised in Sec. 1. As a consequence, in Sec. 6 we will then show that the relaxed energy $\overline{\mathcal{F}}(u)$ is finite if and only if $u \in B V\left(B^{n}, \mathcal{Y}\right)$, and that (0.3) holds true.

The $f$-energy of a current $T \in \operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$ is defined in Sec. 3 by

$$
\begin{aligned}
\mathcal{E}_{f}(T) & :=\int_{B^{n}} f\left(x, u_{T}(x), \nabla u_{T}(x)\right) d x+\int_{B^{n}} f^{\infty}\left(x, u_{T}^{+}(x), \frac{d D^{C} u_{T}}{d\left|D^{C} u_{T}\right|}(x)\right) d\left|D^{C} u_{T}\right| \\
& +\int_{J_{c}(T)} f_{T}(x) d \mathcal{H}^{n-1}(x),
\end{aligned}
$$

where $f^{\infty}: B^{n} \times \mathbb{R}^{N} \times M(N, n) \rightarrow[0,+\infty]$ denotes the recession function of $f$,

$$
f^{\infty}(x, u, G):=\lim _{t \rightarrow+\infty} \frac{f(x, u, t G)-f(x, u, 0)}{t} \quad \forall(x, u, G) \in B^{n} \times \mathbb{R}^{N} \times M(N, n) .
$$

In the last term of the previous formula, $J_{c}(T)$ is the countably $\mathcal{H}^{n-1}$-rectifiable set given by the points of jump-concentration of $T$. Roughly speaking, it is the union of the Jump set $J_{u_{T}}$ of $u_{T}$ and of the ( $n-1$ )-rectifiable set where the "homological vertical part" of $T$ lives. Moreover, $f_{T}(x)$ denotes for any $x \in J_{c}(T)$ the minimal "length" of Lipschitz curves $\gamma:[0,1] \rightarrow \mathcal{Y}$ with end points given by the one sided approximate limits $u_{T}^{ \pm}(x)$ and with image current $\gamma_{\#} \llbracket(0,1) \rrbracket$ equal to the "vertical part" of $T$ over $x$, the length being given for any such $\gamma=\left(\gamma^{1}, \ldots, \gamma^{N}\right)$ by

$$
\mathcal{L}_{f, x}(\gamma):=\int_{0}^{1} \tilde{f}^{\infty}\left(x, \gamma(t),\left(\left|\dot{\gamma}^{1}(t)\right|, \ldots,\left|\dot{\gamma}^{N}(t)\right|\right)\right) d t .
$$

Note that in the model case $f(x, u, G)=|G|$, or $f(x, u, G)=\sqrt{1+|G|^{2}}$, we have $f^{\infty}(x, u, G)=|G|$ and hence $\mathcal{L}_{f, x}(\gamma)$ agrees with the standard length of $\gamma$, compare [12] and [13].

As a consequence, by (0.3) we will obtain that for every map $u \in B V\left(B^{n}, \mathcal{Y}\right)$

$$
\begin{aligned}
\overline{\mathcal{F}}(u) & =\int_{B^{n}} f(x, u(x), \nabla u(x)) d x+\int_{B^{n}} f^{\infty}\left(x, u^{+}(x), \frac{d D^{C} u}{d\left|D^{C} u\right|}(x)\right) d\left|D^{C} u\right| \\
& +\inf \left\{\int_{J_{c}(T)} f_{T}(x) d \mathcal{H}^{n-1}(x) \mid T \in \mathcal{T}_{u}^{1,1}\right\} .
\end{aligned}
$$

We also remark that if the target manifold $\mathcal{Y}$ is simply-connected, i.e., if $\pi_{1}(\mathcal{Y})=0$, for every $u \in$ $B V\left(B^{n}, \mathcal{Y}\right)$ we have

$$
\begin{aligned}
\overline{\mathcal{F}}(u) & =\int_{B^{n}} f(x, u(x), \nabla u(x)) d x+\int_{B^{n}} f^{\infty}\left(x, u^{+}(x), \frac{d D^{C} u}{d\left|D^{C} u\right|}(x)\right) d\left|D^{C} u\right| \\
& +\int_{J_{u}} \Phi_{f, u}(x) d \mathcal{H}^{n-1}(x)
\end{aligned}
$$

where

$$
\Phi_{f, u}(x):=\inf \left\{\mathcal{L}_{f, x}(\gamma) \mid \gamma \in \operatorname{Lip}([0,1], \mathcal{Y}), \gamma(0)=u^{-}(x), \gamma(1)=u^{+}(x)\right\}
$$

Therefore, in the model case $f(x, u, G)=|G|$, or $f(x, u, G)=\sqrt{1+|G|^{2}}, \Phi_{f, u}(x)$ agrees with the geodesic distance between $u^{-}(x)$ and $u^{+}(x)$, compare [2].

Moreover, we will show that the commutativity hypothesis on $\pi_{1}(\mathcal{Y})$ cannot be dropped. Namely, if $\pi_{1}(\mathcal{Y})$ is not an Abelian group we can find $B V$-functions $u \in B V\left(B^{2}, \mathcal{Y}\right)$, smooth outside the origin, for which property (0.3) fails to hold; more precisely:

$$
\overline{\mathcal{F}}(u)>\int_{B^{2}} f(x, u, D u) d x=\inf \left\{\mathcal{E}_{f}(T) \mid T \in \mathcal{T}_{u}^{1,1}\right\}
$$

We finally mention that in the case $\mathcal{Y}=\mathbb{S}^{1}$, the unit sphere of $\mathbb{R}^{2}$, these results have been obtained in [8], and that the main references for this paper are [12] and the books [9] [13].

## 1 Preliminary results

In this section we collect a few known facts that are relevant for the sequel.
VECTOR VALUED $B V$-FUNCTIONS. Let $\Omega \subset \mathbb{R}^{n}$ be an open set and $u: \Omega \rightarrow \mathbb{R}^{N}$ be a function in $B V\left(\Omega, \mathbb{R}^{N}\right)$, i.e., $u=\left(u^{1}, \ldots u^{N}\right)$ with all components $u^{j} \in B V(\Omega)$. The Jump set of $u$ is the countably $\mathcal{H}^{n-1}$-rectifiable set $J_{u}$ in $\Omega$ given by the union of the complements of the Lebesgue sets of the $u^{j}$ 's. Let $\nu=\nu_{u}(x)$ be a unit vector in $\mathbb{R}^{n}$ orthogonal to $J_{u}$ at $\mathcal{H}^{n-1}$-a.e. point $x \in J_{u}$. Let $u^{ \pm}(x)$ denote the one-sided approximate limits of $u$ on $J_{u}$, so that for $\mathcal{H}^{n-1}$-a.e. point $x \in J_{u}$

$$
\lim _{\rho \rightarrow 0^{+}} \rho^{-n} \int_{B_{\rho}^{ \pm}(x)}\left|u(x)-u^{ \pm}(x)\right| d x=0
$$

where $B_{\rho}^{ \pm}(x):=\left\{y \in B_{\rho}(x): \pm\langle y-x, \nu(x)\rangle \geq 0\right\}$. Note that a change of sign of $\nu$ induces a permutation of $u^{+}$and $u^{-}$and that only for scalar functions there is a canonical choice of the sign of $\nu$ which ensures that $u^{+}(x)>u^{-}(x)$. The distributional derivative of $u$ is the sum of a "gradient" measure, which is absolutely continuous with respect to the Lebesgue measure, of a "jump" measure, concentrated on a set that is $\sigma$-finite with respect to the $\mathcal{H}^{n-1}$-measure, and of a "Cantor-type" measure. More precisely,

$$
D u=D^{a} u+D^{J} u+D^{C} u
$$

where

$$
D^{a} u=\nabla u \cdot d x, \quad D^{J} u=\left(u^{+}(x)-u^{-}(x)\right) \otimes \nu(x) \mathcal{H}^{n-1}\left\llcorner J_{u}\right.
$$

$\nabla u:=\left(\nabla_{1} u, \ldots, \nabla_{n} u\right)$ being the approximate gradient of $u$, compare e.g. [3] or [9, Vol. I]. We also recall that $\left\{u_{k}\right\}$ is said to converge to $u$ weakly in the $B V$-sense, $u_{k} \rightharpoonup u$, if $u_{k} \rightarrow u$ strongly in $L^{1}\left(B^{n}, \mathbb{R}^{N}\right)$ and $D u_{k} \rightharpoonup D u$ weakly in the sense of (vector-valued) measures.

One-DIMENSIONAL RESTRICTIONS OF $B V$-FUNCTIONS. Given $\nu \in \mathbb{S}^{n-1}$ we denote by $\pi_{\nu}$ the hyperplane in $\mathbb{R}^{n}$ orthogonal to $\nu$ and by $\Omega_{\nu}$ the orthogonal projection of $\Omega$ on $\pi_{\nu}$. For any $y \in \Omega_{\nu}$ we let

$$
\Omega_{y}^{\nu}:=\{t \in \mathbb{R} \mid y+t \nu \in \Omega\}
$$

denote the (non-empty) section of $\Omega$ corresponding to $y$. Accordingly, for any function $u: B \subset \Omega \rightarrow \mathbb{R}^{N}$ and any $y \in B_{\nu}$ the function $u_{y}^{\nu}: B_{y}^{\nu} \rightarrow \mathbb{R}^{N}$ is defined by

$$
u_{y}^{\nu}(t):=u(y+t \nu)
$$

Proposition 1.1 Let $u \in L^{1}\left(\Omega, \mathbb{R}^{N}\right)$. Then $u \in B V\left(\Omega, \mathbb{R}^{N}\right)$ if and only if there exist $n$ linearly independent unit vectors $\nu_{i}$ such that $u_{y}^{\nu_{i}} \in B V\left(\Omega_{y}^{\nu_{i}}, \mathbb{R}^{N}\right)$ for $\mathcal{L}^{n-1}$-a.e. $y \in \Omega_{\nu_{i}}$ and

$$
\int_{\Omega_{\nu_{i}}}\left|D u_{y}^{\nu_{i}}\right|\left(\Omega_{y}^{\nu_{i}}\right) d \mathcal{L}^{n-1}(y)<\infty \quad \forall i=1, \ldots, n
$$

Theorem 1.2 If $u \in B V\left(\Omega, \mathbb{R}^{N}\right)$ and $\nu \in \mathbb{S}^{n-1}$, then

$$
\begin{array}{ll}
\langle D u, \nu\rangle=\mathcal{L}^{n-1}\left\llcorner\Omega_{\nu} \otimes D u_{y}^{\nu},\right. & \left\langle D^{a} u, \nu\right\rangle=\mathcal{L}^{n-1}\left\llcorner\Omega_{\nu} \otimes D^{a} u_{y}^{\nu},\right. \\
\left\langle D^{J} u, \nu\right\rangle=\mathcal{L}^{n-1}\left\llcorner\Omega_{\nu} \otimes D^{J} u_{y}^{\nu},\right. & \left\langle D^{C} u, \nu\right\rangle=\mathcal{L}^{n-1}\left\llcorner\Omega_{\nu} \otimes D^{C} u_{y}^{\nu} .\right.
\end{array}
$$

In addition, for $\mathcal{L}^{n-1}$-a.e. $y \in \Omega_{\nu}$ the precise representative $u^{*}$ has classical directional derivatives along $\nu \mathcal{L}^{1}$-a.e. in $\Omega_{y}^{\nu}$, the function $\left(u^{*}\right)_{y}^{\nu}$ is a good representative in the equivalence class of $u_{y}^{\nu}$, its Jump set is $\left(J_{u}\right)_{y}^{\nu}$ and

$$
\frac{\partial u^{*}}{\partial \nu}(y+t \nu)=\langle\nabla u(y+t \nu), \nu\rangle \quad \text { for } \mathcal{L}^{1} \text {-a.e. } t \in \Omega_{y}^{\nu}
$$

Finally, $\sigma(t):=\left\langle\nu, \nu_{u}(y+t \nu)\right\rangle \neq 0$ for $\mathcal{L}^{n-1}$-a.e. $y \in \Omega_{\nu}$ and $\mathcal{L}^{1}$-a.e. $t \in \Omega_{y}^{\nu}$, and

$$
\left\{\begin{array}{lll}
\lim _{s \downarrow t} u^{*}(y+s \nu)=u^{+}(y+t \nu), & \lim _{s \uparrow t} u^{*}(y+s \nu)=u^{-}(y+t \nu) & \text { if } \quad \sigma(t)>0 \\
\lim _{s \downarrow t} u^{*}(y+s \nu)=u^{-}(y+t \nu), & \lim _{s \uparrow t} u^{*}(y+s \nu)=u^{+}(y+t \nu) & \text { if } \quad \sigma(t)<0 .
\end{array}\right.
$$

$\mathcal{D}_{n, 1}$-CURRENTS. Let $B^{n}$ be the unit ball in $\mathbb{R}^{N}$ and, we recall,

$$
B V\left(B^{n}, \mathcal{Y}\right):=\left\{u \in B V\left(B^{n}, \mathbb{R}^{N}\right) \mid u(x) \in \mathcal{Y} \quad \text { for } \mathcal{L}^{n} \text {-a.e. } x \in B^{n}\right\}
$$

To every $B V$-map $u \in B V\left(B^{n}, \mathcal{Y}\right)$ we associate a suitable family of currents in the class $\mathcal{D}_{n, 1}\left(B^{n} \times \mathcal{Y}\right)$, i.e., of linear functionals acting on $\mathcal{D}^{n, 1}\left(B^{n} \times \mathcal{Y}\right)$. Here, $\mathcal{D}^{p, 1}\left(B^{n} \times \mathcal{Y}\right)$ denotes the class of smooth compactly supported $p$-forms in $B^{n} \times \mathcal{Y}$ with at most one differential in the vertical $\mathcal{Y}$-direction. Therefore, every $\omega \in \mathcal{D}^{n, 1}\left(B^{n} \times \mathcal{Y}\right)$ splits as

$$
\omega=\omega^{(0)}+\omega^{(1)}
$$

according to the number of $y$-differentials, where

$$
\begin{equation*}
\omega^{(0)}=\phi(x, y) d x, \quad d x:=d x^{1} \wedge \cdots \wedge d x^{n} \tag{1.1}
\end{equation*}
$$

for some $\phi \in C_{c}^{\infty}\left(B^{n} \times \mathcal{Y}\right)$, and

$$
\begin{equation*}
\omega^{(1)}=\sum_{j=1}^{N} \sum_{i=1}^{n}(-1)^{n-i} \phi_{i}^{j}(x, y) \widehat{d x^{i}} \wedge d y^{j} \tag{1.2}
\end{equation*}
$$

for some $\phi^{j}:=\left(\phi_{1}^{j}, \ldots, \phi_{n}^{j}\right) \in C_{0}^{\infty}\left(B^{n} \times \mathcal{Y}, \mathbb{R}^{n}\right)$, where

$$
\widehat{d x^{i}}:=d x^{1} \wedge \cdots \wedge d x^{i-1} \wedge d x^{i+1} \wedge \cdots \wedge d x^{n}
$$

Definition 1.3 $A$ current $G \in \mathcal{D}_{n, 1}\left(B^{n} \times \mathcal{Y}\right)$ is said to be in $B V-\operatorname{graph}\left(B^{n} \times \mathcal{Y}\right)$ if it decomposes into its absolutely continuous, Cantor, and Jump parts

$$
G:=G^{a}+G^{C}+G^{J}
$$

and the following holds:
i) there exists a function $u=u(G) \in B V\left(B^{n}, \mathcal{Y}\right)$, say $u=\left(u^{1}, \ldots, u^{N}\right)$, such that if $\omega^{(0)}$ satisfies (1.1), we have $G^{C}\left(\omega^{(0)}\right)=G^{J}\left(\omega^{(0)}\right)=0$ and

$$
G^{a}\left(\omega^{(0)}\right)=G^{a}(\phi(x, y) d x):=\int_{B^{n}} \phi(x, u(x)) d x
$$

ii) if $\omega=\omega^{(1)}$ satisfies (1.2), we have

$$
\begin{aligned}
G^{a}\left(\omega^{(1)}\right) & :=\sum_{j=1}^{N} \int_{B^{n}}\left\langle\nabla u^{j}, \phi^{j}(x, u(x))\right\rangle d x \\
G^{C}\left(\omega^{(1)}\right) & :=\sum_{j=1}^{N} \int_{B^{n}} \phi^{j}(x, u(x)) d D^{C} u^{j} \\
G^{J}\left(\omega^{(1)}\right) & :=\sum_{j=1}^{N} \sum_{i=1}^{n} \int_{J_{u}}\left(\int_{\gamma_{x}} \phi_{i}^{j}(x, y) d y^{j}\right) \nu_{i} d \mathcal{H}^{n-1}(x),
\end{aligned}
$$

where $\gamma_{x}$ is a 1-dimensional integral chain in $\mathcal{Y}$ satisfying $\partial \gamma_{x}=\delta_{u^{+}(x)}-\delta_{u^{-}(x)}$ and $\delta_{p}$ denotes the unit Dirac mass at the point $p \in \mathbb{R}^{N}$.

The previous definition clearly depends on the choice of the $\gamma_{x}$ 's connecting the one-sided approximate limits $u^{ \pm}(x)$ at $x \in J_{u}$. Moreover, if $u$ is smooth, at least $u \in W^{1,1}\left(B^{n}, \mathcal{Y}\right)$, it turns out that $G=G^{a}$ and hence $G$ agrees with the current $G_{u}$ carried by the rectifiable graph of $u$, where, we recall, $G_{u} \in \mathcal{D}_{n, 1}\left(B^{n} \times \mathcal{Y}\right)$ is defined in an approximate sense by

$$
\begin{equation*}
G_{u}:=(I d \bowtie u)_{\#} \llbracket B^{n} \rrbracket, \tag{1.3}
\end{equation*}
$$

i.e., by letting $G_{u}(\omega)=(I d \bowtie u)^{\#}(\omega)$ for every $\omega \in \mathcal{D}^{n, 1}\left(B^{n} \times \mathcal{Y}\right)$, where $(I d \bowtie u)(x):=(x, u(x))$.

Remark 1.4 If $n \geq 2$ in general the current $G$ has a non-zero boundary in $B^{n} \times \mathcal{Y}$, even if $u \in$ $W^{1,1}\left(B^{n}, \mathcal{Y}\right)$. Taking for example $n=2, \mathcal{Y}=\mathbb{S}^{1} \subset \mathbb{R}^{2}$, and $u(x)=x /|x|$, we have

$$
\partial G\left\llcorner B^{2} \times \mathbb{S}^{1}=-\delta_{0} \times \llbracket \mathbb{S}^{1} \rrbracket\right.
$$

where $\delta_{0}$ is the unit Dirac mass at the origin, see [9, Vol. I, Sec. 3.2.2].
WEAK LIMITS OF SMOOTH GRAPHS. A first step in the study of our relaxation results is the analysis of the weak limits of sequences $\left\{G_{u_{k}}\right\}$ of currents carried by the graphs of smooth maps $u_{k} \in C^{1}\left(B^{n}, \mathcal{Y}\right)$ with equibounded $W^{1,1}$-energies, $\sup _{k}\left\|D u_{k}\right\|_{L^{1}}<\infty$, compare [12] [13]. Possibly passing to a subsequence, we infer that $G_{u_{k}} \rightharpoonup T$ weakly in $\mathcal{D}_{n, 1}$ to some current $T \in \mathcal{D}_{n, 1}\left(B^{n} \times \mathcal{Y}\right)$, i.e.,

$$
\lim _{k \rightarrow \infty} G_{u_{k}}(\omega)=T(\omega) \quad \forall \omega \in \mathcal{D}^{n, 1}\left(B^{n} \times \mathcal{Y}\right)
$$

and $u_{k} \rightharpoonup u_{T}$ weakly in the $B V$-sense to some function $u_{T} \in B V\left(B^{n}, \mathcal{Y}\right)$. This yields that if $\omega \in$ $\mathcal{D}^{n, 1}\left(B^{n} \times \mathcal{Y}\right)$ is completely horizontal, see (1.1), we clearly obtain (0.5).

Since by Stokes theorem the $G_{u_{k}}$ 's have no boundary in $B^{n} \times \mathcal{Y}$, by the weak convergence we also infer

$$
\begin{equation*}
\partial T=0 \quad \text { on } \quad \mathcal{Z}^{n-1,1}\left(B^{n} \times \mathcal{Y}\right) \tag{1.4}
\end{equation*}
$$

where, we recall, $\partial T(\omega):=T(d \omega)$. Here, $\mathcal{Z}^{p, 1}\left(B^{n} \times \mathcal{Y}\right)$ denotes the class of $p$-forms $\omega$ in $\mathcal{D}^{p, 1}\left(B^{n} \times \mathcal{Y}\right)$ for which the "vertical" $d_{y}$-differential of the component $\omega^{(1)}$ of $\omega$ with exactly one vertical differential vanishes,

$$
\mathcal{Z}^{p, 1}\left(B^{n} \times \mathcal{Y}\right):=\left\{\omega \in \mathcal{D}^{p, 1}\left(B^{n} \times \mathcal{Y}\right) \mid d_{y} \omega^{(1)}=0\right\}
$$

We may and do associate to the weak limit current $T$ a current $G_{T} \in B V-\operatorname{graph}\left(B^{n} \times \mathcal{Y}\right)$, see Definition 1.3, where the function $u=u\left(G_{T}\right) \in B V\left(B^{n}, \mathcal{Y}\right)$ is given by $u_{T}$ and the $\gamma_{x}$ 's in the definition of the jump part $G_{T}^{J}$ are e.g. the indecomposable 1-dimensional integral chains obtained as in Definition 3.2 below. Setting then

$$
S_{T}:=T-G_{T}
$$

by (0.5) we clearly have $S_{T}(\phi(x, y) d x)=0$ for every $\phi \in C_{c}^{\infty}\left(B^{n} \times \mathcal{Y}\right)$. In general $\partial G_{T}\left\llcorner B^{n} \times \mathcal{Y} \neq 0\right.$, see Remark 1.4. However, on account of (1.4) we proved in [12]:

Proposition 1.5 $S_{T}(\omega)=0$ for every form $\omega=\omega^{(1)}$ such that $\omega=d_{y} \widetilde{\omega}$ for some $\widetilde{\omega} \in \mathcal{D}^{n-1,0}\left(B^{n} \times \mathcal{Y}\right)$.
Homological facts. Since $H_{1}(\mathcal{Y})$ has no torsion, there are generators $\left[\gamma_{1}\right], \ldots,\left[\gamma_{\bar{s}}\right]$, i.e. integral 1-cycles in $\mathcal{Z}_{1}(\mathcal{Y})$, such that

$$
H_{1}(\mathcal{Y})=\left\{\sum_{s=1}^{\bar{s}} n_{s}\left[\gamma_{s}\right] \mid n_{s} \in \mathbb{Z}\right\}
$$

see e.g. [9], Vol. I, Sec. 5.4.1. By de Rham's theorem the first real homology group is in duality with the first cohomology group $H_{d R}^{1}(\mathcal{Y})$, the duality being given by the natural pairing

$$
\langle[\gamma],[\omega]\rangle:=\gamma(\omega)=\int_{\gamma} \omega, \quad[\gamma] \in H_{1}(\mathcal{Y} ; \mathbb{R}), \quad[\omega] \in H_{d R}^{1}(\mathcal{Y})
$$

We will then denote by $\left[\omega^{1}\right], \ldots,\left[\omega^{\bar{s}}\right]$ a dual basis in $H_{d R}^{1}(\mathcal{Y})$ so that $\gamma_{s}\left(\omega^{r}\right)=\delta_{s r}$, where $\delta_{s r}$ denotes the Kronecker symbols. Finally, in the sequel $\pi: \mathbb{R}^{n+N} \rightarrow \mathbb{R}^{n}$ and $\widehat{\pi}: \mathbb{R}^{n+N} \rightarrow \mathbb{R}^{N}$ shall denote the projections onto the first $n$ and the last $N$ coordinates, respectively.

By Proposition 1.5, similarly to [9], Vol. II, Sec. 5.4.3, we infer that the weak limit current $T$ is given by

$$
T=G_{T}+S_{T}, \quad \text { where } \quad S_{T}=\sum_{s=1}^{\bar{s}} \mathbb{L}_{s}(T) \times \gamma_{s} \quad \text { on } \quad \mathcal{Z}^{n, 1}\left(B^{n} \times \mathcal{Y}\right)
$$

$\mathbb{L}_{s}(T) \in \mathcal{D}_{n-1}\left(B^{n}\right)$ being defined by

$$
\mathbb{L}_{s}(T):=(-1)^{n-1} \pi^{\#}\left(S_{T}\left\llcorner\widehat{\pi}^{\#} \omega^{s}\right), \quad s=1, \ldots, \bar{s},\right.
$$

so that

$$
\mathbb{L}_{s}(T)(\phi)=S_{T}\left(\pi^{\#} \phi \wedge \widehat{\pi}^{\#} \omega^{s}\right) \quad \forall \phi \in \mathcal{D}^{n-1}\left(B^{n}\right)
$$

By the equiboundedness of the $W^{1,1}$-energies of the $u_{k}$ 's, and by the lower semicontinuity of the $\mathcal{E}_{1,1}$ norm in $\mathcal{D}_{n, 1}$, we finally infer that the weak limit current $T$ has finite $\mathcal{E}_{1,1}$-norm, $\|T\|_{\mathcal{E}_{1,1}}<+\infty$, where, for $\omega \in \mathcal{D}^{n, 1}\left(B^{n} \times \mathcal{Y}\right)$ and $T \in \mathcal{D}_{n, 1}\left(B^{n} \times \mathcal{Y}\right)$,

$$
\begin{align*}
& \|\omega\|_{\mathcal{E}_{1,1}}:=\max \left\{\sup _{x, y} \frac{\left|\omega^{(0)}(x, y)\right|}{1+|y|}, \int_{B^{n}} \sup _{y}\left|\omega^{(1)}(x, y)\right| d x\right\},  \tag{1.5}\\
& \|T\|_{\mathcal{E}_{1,1}}:=\sup \left\{T(\omega) \mid \omega \in \mathcal{D}^{n, 1}\left(B^{n} \times \mathcal{Y}\right),\|\omega\|_{\mathcal{E}_{1,1}} \leq 1\right\} .
\end{align*}
$$

Remark 1.6 Setting

$$
S_{T, \text { sing }}:=T-G_{T}-\sum_{s=1}^{\bar{s}} \mathbb{L}_{s}(T) \times \gamma_{s}
$$

it turns out that $S_{T, s i n g}$ is nonzero only possibly on forms $\omega$ with non-zero vertical component, $\omega^{(1)} \neq 0$, and such that $d_{y} \omega^{(1)} \neq 0$. Therefore, $S_{T, \text { sing }} \equiv 0$ on forms in $\mathcal{Z}^{n, 1}\left(B^{n} \times \mathcal{Y}\right)$, hence $S_{T, \text { sing }}$ does not carry homology. However, even if $T$ is the weak limit of a sequence of smooth graphs with equibounded Dirichlet energies, in principle $S_{T, s i n g}$ may be any measure.

VERTICAL HOMOLOGY CLASSES. Finally, it is convenient to consider vertical homology equivalence classes of currents satisfying the same structure properties as weak limits of graphs of smooth maps $u_{k}$ : $B^{n} \rightarrow \mathcal{Y}$ with equibounded total variation, $\sup _{k}\left\|D u_{k}\right\|_{L^{1}}<\infty$. More precisely, we say that

$$
\begin{equation*}
T \sim \widetilde{T} \Longleftrightarrow T(\omega)=\widetilde{T}(\omega) \quad \forall \omega \in \mathcal{Z}^{n, 1}\left(B^{n} \times \mathcal{Y}\right) \tag{1.6}
\end{equation*}
$$

Moreover, we will say that $T_{k} \rightharpoonup T$ weakly in $\mathcal{Z}_{n, 1}\left(B^{n} \times \mathcal{Y}\right)$ if $T_{k}(\omega) \rightarrow T(\omega)$ for every $\omega \in \mathcal{Z}^{n, 1}\left(B^{n} \times \mathcal{Y}\right)$.
Definition 1.7 We denote by $\mathcal{E}_{1,1}-\operatorname{graph}\left(B^{n} \times \mathcal{Y}\right)$ the set of equivalence classes, in the sense of (1.6), of currents $T$ in $\mathcal{D}_{n, 1}\left(B^{n} \times \mathcal{Y}\right)$ which have no interior boundary,

$$
\partial T=0 \quad \text { on } \quad \mathcal{Z}^{n-1,1}\left(B^{n} \times \mathcal{Y}\right)
$$

finite $\mathcal{E}_{1,1}$-norm, i.e.

$$
\|T\|_{\mathcal{E}_{1,1}}:=\sup \left\{T(\omega) \mid \omega \in \mathcal{Z}^{n, 1}\left(B^{n} \times \mathcal{Y}\right),\|\omega\|_{\mathcal{E}_{1,1}} \leq 1\right\}<\infty
$$

and decompose as

$$
\begin{equation*}
T=G_{T}+S_{T}, \quad S_{T}=\sum_{s=1}^{\bar{s}} \mathbb{L}_{s}(T) \times \gamma_{s} \quad \text { on } \quad \mathcal{Z}^{n, 1}\left(B^{n} \times \mathcal{Y}\right) \tag{1.7}
\end{equation*}
$$

where $G_{T} \in B V-\operatorname{graph}\left(B^{n} \times \mathcal{Y}\right)$, see Definition 1.3 , and $\mathbb{L}_{s}(T)$ is an i.m. rectifiable current in $\mathcal{R}_{n-1}\left(B^{n}\right)$ for every $s$.

Remark 1.8 If $\widetilde{T} \sim T$, in general $G_{\widetilde{T}} \neq G_{T}$. However, the corresponding $B V$-functions coincide, i.e., $u\left(G_{T}\right)=u\left(G_{\widetilde{T}}\right)$, see Definition 1.3. This yields that we may refer to the underlying functions $u_{T} \in$ $B V\left(B^{n}, \mathcal{Y}\right)$ associated to currents $T$ in $\mathcal{E}_{1,1}-\operatorname{graph}\left(B^{n} \times \mathcal{Y}\right)$.

## 2 Parametric variational integrals on currents

In this section we shall consider integrands $f: B^{n} \times \mathbb{R}^{N} \times M(N, n) \rightarrow \mathbb{R}_{+}$, where $M(N, n)$ is the class of real $(N \times n)$-matrices and $\mathbb{R}_{+}:=[0,+\infty)$, satisfying the following properties:
(a) $G \mapsto f(x, u, G)$ is convex and lower semicontinuous in $M(N, n)$ for every $(x, u) \in B^{n} \times \mathbb{R}^{N}$;
(b) $C_{1}|G| \leq f(x, u, G) \leq C_{2}(1+|G|)$ for every $(x, u, G) \in B^{n} \times \mathbb{R}^{N} \times M(N, n)$ and for some absolute constants $C_{i}>0$;
(c) for every $\left(x_{0}, u_{0}\right) \in B^{n} \times \mathbb{R}^{N}$ and $\varepsilon>0$ there exists $\delta>0$ such that

$$
f(x, u, G) \geq(1-\varepsilon) f\left(x_{0}, u_{0}, G\right) \quad \forall G \in M(N, n)
$$

for every $(x, u) \in B^{n} \times \mathbb{R}^{N}$ such that $\left|x-x_{0}\right|<\delta$ and $\left|u-u_{0}\right|<\delta$.
We shall discuss the parametric polyconvex l.s.c. extension of $f$ for mappings from $B^{n}$ into $\mathbb{R}^{N}$ that are constrained to take values into a smooth submanifold $\mathcal{Y} \subset \mathbb{R}^{N}$, and the related parametric variational integral for currents in $\mathcal{E}_{1,1}-\operatorname{graph}\left(B^{n} \times \mathcal{Y}\right)$.

The RECESSION FUNCTION. Property (a) allows us to give the
Definition 2.1 The recession function $f^{\infty}: B^{n} \times \mathbb{R}^{N} \times M(N, n) \rightarrow \overline{\mathbb{R}}_{+}:=[0,+\infty]$ of $f$ is defined by

$$
f^{\infty}(x, u, G):=\lim _{t \rightarrow+\infty} \frac{f_{x, u}(t G)-f_{x, u}(0)}{t} \quad \forall(x, u, G) \in B^{n} \times \mathbb{R}^{N} \times M(N, n)
$$

It turns out that for every $(x, u)$ the function $G \mapsto f_{x, u}^{\infty}(G):=f^{\infty}(x, u, G)$ is positively homogeneous of degree one, convex and lower semicontinuous. Moreover, property (b) yields that $G \mapsto f_{x, u}^{\infty}(G):=$ $f^{\infty}(x, u, G)$ is actually real valued and hence continuous for every $(x, u)$.

Notation On multivectors. Let $\Lambda_{n} \mathbb{R}^{n+N}$ denote the space of $n$-vectors in $\mathbb{R}^{n+N}$. For $0 \leq k \leq$ $\min (n, N)$, we let

$$
V_{n, k}:=\Lambda_{n-k} \mathbb{R}^{n} \otimes \Lambda_{k} \mathbb{R}^{N}
$$

and denote by $\xi_{(k)} \in V_{n, k}$ the "component" of an $n$-vector $\xi \in \Lambda_{n} \mathbb{R}^{n+N}$ with $k$ "vertical" components. For example, denoting by $\left(e_{1}, \ldots, e_{n}\right)$ and $\left(\varepsilon_{1}, \ldots, \varepsilon_{N}\right)$ the canonical basis in $\mathbb{R}^{n}$ and $\mathbb{R}^{N}$, respectively,

$$
\xi_{(0)}=\xi^{\overline{0} 0} e_{1} \wedge \cdots \wedge e_{n}
$$

$\xi^{\overline{0} 0} \in \mathbb{R}$ being the first component of $\xi \in \Lambda_{n} \mathbb{R}^{n+N}$. Moreover, we have

$$
\xi_{(1)}=\sum_{j=1}^{N} \sum_{i=1}^{n} \xi_{i}^{j} \widehat{e_{i}} \wedge \varepsilon_{j}, \quad \widehat{e}_{i}:=e_{1} \wedge \cdots \wedge e_{i-1} \wedge e_{i+1} \wedge \cdots \wedge e_{n}
$$

for some $\xi_{i}^{j} \in \mathbb{R}$. We set

$$
\begin{aligned}
\Lambda_{1} & :=\left\{\xi \in \Lambda_{n} \mathbb{R}^{n+N} \mid \xi^{\overline{0} 0}=1\right\} \\
\Lambda_{+} & :=\left\{\xi \in \Lambda_{n} \mathbb{R}^{n+N} \mid \xi^{\overline{0} 0}>0\right\} \\
\Lambda_{0} & :=\left\{\xi \in \Lambda_{n} \mathbb{R}^{n+N} \mid \xi^{\overline{00}}=0\right\}
\end{aligned}
$$

We also denote by $\Sigma$ the class of simple $n$-vectors in $\Lambda_{n} \mathbb{R}^{n+N}$ and

$$
\begin{aligned}
\Sigma_{1} & :=\left\{\xi \in \Sigma \mid \xi^{\overline{0} 0}=1\right\} \\
\Sigma_{+} & :=\left\{\xi \in \Sigma \mid \xi^{\overline{0} 0}>0\right\}
\end{aligned}
$$

If $G \in M(N, n)$, the vectors $e_{i}+G e_{i} \in \mathbb{R}^{n+N}, i=1, \ldots, n$, yield a basis of the tangent $n$-plane to the graph of $G$ in $\mathbb{R}^{n+N}$ that agrees with the graph of $G$. Letting

$$
M(G):=\left(e_{1}+G e_{1}\right) \wedge \cdots \wedge\left(e_{n}+G e_{n}\right) \in \Lambda_{n} \mathbb{R}^{n+N}
$$

we find that the unit simple $n$-vector

$$
\xi_{G}:=\frac{M(G)}{|M(G)|}
$$

called the tangent n-vector to the graph of $G$, identifies the plane graph of $G$, and in fact orients such an $n$-plane. We also see that the map $M: M(N, n) \rightarrow \Lambda_{n} \mathbb{R}^{n+N}$ given by $G \mapsto M(G)$ is injective. Moreover, if $M_{(k)}: M(N, n) \rightarrow V_{n, k}$ is the map given by $G \mapsto M_{(k)}(G)$, it turns out that $M_{(1)}$ yields an isometry of linear spaces. Notice that $M_{(0)}(G)=e_{1} \wedge \cdots \wedge e_{n}$ and

$$
M_{(1)}(G)=\sum_{j=1}^{N} \sum_{i=1}^{n}(-1)^{n-i} G_{i}^{j} \widehat{e_{i}} \wedge \varepsilon_{j}, \quad G=\left(G_{i}^{j}\right)_{j, i=1}^{N, n}
$$

Therefore, to every $\xi \in \Lambda_{+}$we can associate the matrix $G_{\xi} \in M(N, n)$ defined by

$$
G_{\xi}:=M_{(1)}^{-1}\left(\frac{\xi_{(1)}}{\xi^{\overline{0} 0}}\right)
$$

Note that for every $\xi \in \Lambda_{+}$we have

$$
G_{\xi}=0 \quad \text { if and only if } \quad \xi_{(1)}=0
$$

and

$$
G_{\lambda \xi}=G_{\xi} \quad \forall \lambda>0
$$

Most importantly, $G_{\xi}=M^{-1}(\xi)$ if $\xi \in \Sigma_{1}$, i.e.

$$
\left\{\begin{array}{lc}
G_{M(G)}=G & \forall G \in M(N, n)  \tag{2.1}\\
\xi=M\left(G_{\xi}\right) & \Longleftrightarrow \quad \xi \in \Sigma_{1}
\end{array}\right.
$$

and finally

$$
\xi \in \Lambda_{+} \quad \text { is simple if and only if } \frac{\xi}{\xi^{\overline{0} 0}}=M\left(G_{\xi}\right) .
$$

The PARAMETRIC POLYCONVEX L.S.C. ENVELOPE. Consider the map

$$
\underline{f}: \Omega \times \mathbb{R}^{N} \times \Sigma_{1} \rightarrow \overline{\mathbb{R}}_{+}
$$

defined, according to (2.1), by

$$
\underline{f}(x, u, \xi):=f\left(x, u, G_{\xi}\right) .
$$

Taking $x, u$ as parameters, we consider the parametric polyconvex l.s.c. envelope of the integrand $G \mapsto$ $f_{x, u}(G):=f(x, u, G)$, given by the convex l.s.c. envelope of $\xi \mapsto \bar{f}_{x, u}(\xi)$,

$$
F_{x, u}(\cdot):=\Gamma C \bar{f}_{x, u}(\cdot)
$$

where

$$
\bar{f}_{x, u}(\xi):= \begin{cases}\xi^{\overline{0} 0} \underline{f}\left(x, u, \xi / \xi^{\overline{0} 0}\right)=\xi^{\overline{0} 0} f_{x, u}\left(G_{\xi}\right) & \text { if } \xi \in \Sigma_{+} \\ +\infty & \text { otherwise }\end{cases}
$$

Since in principle $(x, u, \xi) \mapsto F_{x, u}(\xi)$ is not l.s.c., we set
Definition 2.2 The parametric polyconvex l.s.c. envelope of a function $f: B^{n} \times \mathbb{R}^{N} \times M(N, n) \rightarrow \overline{\mathbb{R}}_{+}$is the function $F: B^{n} \times \mathbb{R}^{N} \times \Lambda_{n} \mathbb{R}^{n+N} \rightarrow \overline{\mathbb{R}}_{+}$defined by

$$
\begin{array}{r}
F(x, u, \xi):=\sup \left\{g(x, u, \xi) \mid g: B^{n} \times \mathbb{R}^{N} \times \Lambda_{n} \mathbb{R}^{n+N} \rightarrow \overline{\mathbb{R}}_{+}\right. \\
g \text { is l.s.c., } g(y, v, \cdot) \text { is convex for any } y, v \\
\left.g(y, v, \eta) \leq \bar{f}_{y, v}(\eta) \text { for any }(y, v, \eta)\right\}
\end{array}
$$

We emphasize that $F(x, u, \xi)$ is l.s.c. in all variables and convex in $\xi$ for any $x$, $u$. Notice that in general $F(x, u, \xi) \leq \Gamma C \bar{f}_{x, u}(\xi)$. However, the equality

$$
\begin{equation*}
F(x, u, \xi)=\Gamma C \bar{f}_{x, u}(\xi) \tag{2.2}
\end{equation*}
$$

holds if and only if $(x, u, \xi) \mapsto \Gamma C \bar{f}_{x, u}(\xi)$ is l.s.c., and we actually have that property (c) yields (2.2). Moreover, for every $(x, u) \in B^{n} \times \mathbb{R}^{N}$ we have

$$
\begin{align*}
F(x, u, \xi)=\sup \left\{\phi(\xi) \mid \phi: \Lambda_{n} \mathbb{R}^{n+N}\right. & \rightarrow \overline{\mathbb{R}}_{+}, \phi \text { linear, }  \tag{2.3}\\
\phi(M(G)) \leq f(x, u, G) & \forall G \in M(N, n)\}
\end{align*}
$$

for every $\xi \in \Lambda_{n} \mathbb{R}^{n+N}$. Arguing as in [9, Vol. II], we then obtain:
Proposition 2.3 If the integrand $f$ satisfies the properties $(a),(b),(c)$, its parametric polyconvex l.s.c. envelope is given for every $(x, u) \in B^{n} \times \mathbb{R}^{N}$ by

$$
\|\xi\|_{f_{x, u}}:=F(x, u, \xi)= \begin{cases}\xi^{\overline{0} 0} f\left(x, u, G_{\xi}\right) & \text { if } \xi \in \Sigma_{+}  \tag{2.4}\\ f^{\infty}\left(x, u, M_{(1)}^{-1}\left(\xi_{(1)}\right)\right) & \text { if } \xi \in\left(\Lambda_{+} \cup \Lambda_{0}\right) \backslash \Sigma_{+} \\ +\infty & \text { otherwise }\end{cases}
$$

Proof: On account of (2.3), we decompose every linear map $\phi: \Lambda_{n} \mathbb{R}^{n+N} \rightarrow \overline{\mathbb{R}}_{+}$as $\phi=\sum_{k=0}^{n} \phi_{k}$, where $\underline{n}:=\min (n, N)$ and the $\phi_{k}$ 's are linear maps on $V_{n, k}$. The condition $\phi(M(G)) \leq f(x, u, G) \leq C_{2}(1+|G|)$ for all $G \in M(N, n)$ yields by homogeneity that $\phi_{k}=0$ for $k=2, \ldots, \underline{n}$ and

$$
\phi_{0}(\vec{e})+\phi_{1}\left(M_{(1)}(G)\right) \leq f(x, u, G) \quad \forall G \in M(N, n)
$$

where $\vec{e}:=e_{1} \wedge \cdots \wedge e_{n}$, so that for any $\xi \in \Lambda_{1}$ we have

$$
\left.\begin{array}{rl}
\|\xi\|_{f_{x, u}}= & \sup \left\{a+\phi_{1}\left(\xi_{(1)}\right) \mid a \in \mathbb{R}, \phi_{1}: V_{n, 1} \rightarrow \overline{\mathbb{R}}_{+}\right. \text {linear, } \\
& a+\phi_{1}\left(M_{(1)}(G)\right) \leq f(x, u, G)
\end{array} \forall G \in M(N, n)\right\}
$$

and hence $\|\xi\|_{f_{x, u}}=F\left(x, u, M\left(G_{\xi}\right)\right)$, see (2.3), if we take into account that $\xi_{(0)}=M_{(0)}\left(G_{\xi}\right)=\vec{e}$ and $\xi_{(1)}=M_{(1)}\left(G_{\xi}\right)$. On the other hand the maps $G \mapsto a+\phi_{1}\left(M_{(1)}(G)\right)$ are affine and $G \mapsto f(x, u, G)$ is convex. Then, the maximum of $a+\phi_{1}\left(M_{(1)}(G)\right)$ under the constraint $a+\phi_{1}\left(M_{(1)}(G)\right) \leq f(x, u, G)$ is taken for $a$ and $\phi_{1}$ such that

$$
a+\phi_{1}\left(M_{(1)}(G)\right)=f^{\infty}(x, u, G) .
$$

Therefore,

$$
\|\xi\|_{f_{x, u}}=F\left(x, u, M\left(G_{\xi}\right)\right)=f^{\infty}\left(x, u, G_{\xi}\right)
$$

and the claim is proved for $\xi \in \Lambda_{1}$. By homogeneity we obtain $\|\xi\|_{f_{x, u}}=f^{\infty}\left(x, u, M_{(1)}^{-1}\left(\xi_{(1)}\right)\right)$ for every $\xi \in \Lambda_{+}$. The continuity of $\xi \mapsto f^{\infty}\left(x, u, M_{(1)}^{-1}\left(\xi_{(1)}\right)\right)$ yields the result also for $\xi \in \Lambda_{0}$.

Remark 2.4 In the model case $f(x, u, G):=|G|$, or $f(x, u, G):=\sqrt{1+|G|^{2}}$, we clearly have

$$
\|\xi\|_{f_{x, u}}= \begin{cases}\xi^{\overline{00} 0} f\left(x, u, G_{\xi}\right) & \text { if } \xi \in \Sigma_{+} \\ \left|\xi_{(1)}\right| & \text { if } \xi \in\left(\Lambda_{+} \cup \Lambda_{0}\right) \backslash \Sigma_{+} \\ +\infty & \text { otherwise. }\end{cases}
$$

We deal with mappings that are constrained to take values into a smooth manifold $\mathcal{Y}$ isometrically embedded in $\mathbb{R}^{N}$. To this purpose, we replace the integrand $f$ in Definition 2.2 with the integrand $\widehat{f}$ : $B^{n} \times \mathbb{R}^{N} \times \Lambda_{n} \mathbb{R}^{n+N} \rightarrow \overline{\mathbb{R}}_{+}$defined by

$$
\widehat{f}(x, u, G):=\left\{\begin{array}{ll}
f(x, u, G) & \text { if } u \in \mathcal{Y} \\
+\infty & \text { otherwise },
\end{array} \text { and } \quad G \in S_{u}\right.
$$

where

$$
S_{u}:=\left\{G \in M(N, n) \mid G \in T_{u} \mathcal{Y}\right\}, \quad u \in \mathcal{Y},
$$

$T_{u} \mathcal{Y}$ being the tangent space to $\mathcal{Y}$ at $u$. We denote by $F_{f}(x, u, \xi): B^{n} \times \mathbb{R}^{N} \times \Lambda_{n} \mathbb{R}^{n+N} \rightarrow \overline{\mathbb{R}}_{+}$the parametric polyconvex l.s.c. extension of the integrand $\widehat{f}$, i.e., for mappings from $B^{n}$ into $\mathbb{R}^{N}$ that are constrained to take values into the given submanifold $\mathcal{Y} \subset \mathbb{R}^{N}$. The $n$-vector $M(G)$ corresponding to matrices $G \in S_{u}$ belongs to the subspace $\Lambda_{n}\left(\mathbb{R}^{N} \times T_{u} \mathcal{Y}\right)$. This yields to the following property, compare [9, Vol. II, Sec. 1.2.4] or [13, Sec. 4.8].

Proposition 2.5 We have:

$$
F_{f}(x, u, \xi):= \begin{cases}\|\xi\|_{f_{x, u}} & \text { if } u \in \mathcal{Y}, \xi \in \Lambda_{n}\left(\mathbb{R}^{n} \times T_{u} \mathcal{Y}\right)  \tag{2.5}\\ +\infty & \text { otherwise },\end{cases}
$$

where $\|\xi\|_{f_{x, u}}$ is given by (2.4) and $T_{u} \mathcal{Y}$ is the tangent space to $\mathcal{Y}$ at $u$.

Parametric variational integral. If $T \in \mathcal{D}_{n, 1}\left(B^{n} \times \mathcal{Y}\right)$ is such that $\|T\|_{\mathcal{E}_{1,1}}<\infty$, we denote

$$
T=\|T\|_{\mathcal{E}_{1,1}}\llcorner\vec{T}
$$

the Radon-Nikodym decomposition of $T$ with respect to the $\mathcal{E}_{1,1}$-norm, see (1.5). Here $T$ is identified with the $\mathbb{R}^{1+N n}$-valued linear functional

$$
T:=\left(T^{\overline{0} 0},\left(T^{\bar{i} j}\right)_{\mathbb{R}^{N n}}\right), \quad i=1, \ldots n, \quad j=1, \ldots N .
$$

The parametric variational integral associated to the integrand $f$ is defined for every Borel set $B \subset B^{n}$

$$
\begin{equation*}
\mathcal{F}_{f}(T, B \times \mathcal{Y}):=\int_{B \times \mathcal{Y}} F_{f}(\pi(z), \widehat{\pi}(z), \vec{T}(z)) d\|T\|_{\mathcal{E}_{1,1}}(z) \tag{2.6}
\end{equation*}
$$

where $F_{f}(x, u, \xi)$ is given by (2.5), and we let

$$
\mathcal{F}_{f}(T):=\mathcal{F}_{f}\left(T, B^{n} \times \mathcal{Y}\right)
$$

Since $\|T\|_{\mathcal{E}_{1,1}}<\infty$, by property (b) we infer that $\mathcal{F}_{f}(T)<\infty$. Moreover, the following lower semicontinuity property trivially holds.

Proposition 2.6 Let $\left\{T_{k}\right\} \subset \mathcal{D}_{n, 1}\left(B^{n} \times \mathcal{Y}\right)$ be such that $\sup _{k}\left\|T_{k}\right\|_{\mathcal{E}_{1,1}}<\infty$ and $T_{k} \rightharpoonup T$ weakly in $\mathcal{D}_{n, 1}$. Then

$$
\mathcal{F}_{f}(T) \leq \liminf _{k \rightarrow \infty} \mathcal{F}_{f}\left(T_{k}\right)
$$

AN EXPLICIT FORMULA. If $T=G \in B V-\operatorname{graph}\left(B^{n} \times \mathcal{Y}\right)$ for some $B V$-function $u=u(G) \in$ $B V\left(B^{n}, \mathcal{Y}\right)$ with no jump-part, $\left|D^{J} u\right|\left(B^{n}\right)=0$, see Definition 1.3 , it is readily checked that

$$
\begin{equation*}
\mathcal{F}_{f}(T, B \times \mathcal{Y})=\int_{B} f(x, u(x), \nabla u(x)) d x+\int_{B} f^{\infty}\left(x, u^{+}(x), \frac{d D^{C} u}{d\left|D^{C} u\right|}(x)\right) d\left|D^{C} u\right| \tag{2.7}
\end{equation*}
$$

If $T \in \mathcal{E}_{1,1}-\operatorname{graph}\left(B^{n} \times \mathcal{Y}\right)$ and the singular part $S_{T, \text { sing }}$ vanishes, i.e., if (1.7) holds on the whole of $\mathcal{D}^{n, 1}\left(B^{n} \times \mathcal{Y}\right)$, then an explicit formula can be obtained. For example, let $\mathcal{Y}=\mathbb{S}^{1} \subset \mathbb{R}^{2}$, the unit sphere, and $G=G^{a}=(I d \bowtie u)_{\#} \llbracket B^{n} \rrbracket$ for some $u \in W^{1,1}\left(B^{n}, \mathcal{Y}\right)$, i.e., $G^{C}=G^{J}=0$. In this case

$$
T=G_{u}+L \times \llbracket \mathbb{S}^{1} \rrbracket
$$

for some i.m. rectifiable current $L \in \mathcal{R}_{n-1}\left(B^{n}\right)$, say $L=\tau(\mathcal{L}, \theta, \overrightarrow{\mathcal{L}})$. If $f$ is isotropic, i.e., $f(x, u, G)=$ $\widehat{f}(x, u,|G|)$, where $\widehat{f}: B^{n} \times \mathbb{R}^{N} \times \mathbb{R}_{+} \rightarrow \mathbb{R}_{+}$, we readily obtain

$$
\mathcal{F}_{f}(T)=\int_{B^{n}} \widehat{f}(x, u,|D u|) d x+\int_{\mathcal{L}} \theta(x)\left(\int_{0}^{2 \pi} \widehat{f}^{\infty}(x,(\cos \theta, \sin \theta), 1) d t\right) d \mathcal{H}^{n-1}
$$

GAP PHENOMENON. As noticed in [8], see Sec. 5 below, in the simple case $\mathcal{Y}=\mathbb{S}^{1}$, the unit circle in $\mathbb{R}^{2}$, and in any dimension $n$, for any current $T \in \mathcal{E}_{1,1}-\operatorname{graph}\left(B^{n} \times \mathbb{S}^{1}\right)$ such that $\mathcal{F}_{f}(T)<\infty$ we can find a sequence of smooth maps $\left\{u_{k}\right\} \subset C^{1}\left(B^{n}, \mathbb{S}^{1}\right)$ such that $G_{u_{k}}$ weakly converges to $T$ in $\mathcal{D}_{n}\left(B^{m} \times \mathbb{S}^{1}\right)$ and the $f$-energies the $u_{k}$ 's converge to the parametric variational integral of $T$, i.e.,

$$
\lim _{k \rightarrow \infty} \mathcal{F}_{f}\left(G_{u_{k}}\right)=\lim _{k \rightarrow \infty} \int_{B^{n}} f\left(x, u_{k}, D u_{k}\right) d x=\mathcal{F}_{f}(T)
$$

see [8] and [9, Vol. II, Sec. 6.2.2]. However, in case of general target manifolds, even in the model case $f(x, u, G):=|G|$ and in dimension $n=1$, a gap phenomenon occurs, see [12]. More precisely, in general for every smooth sequence $\left\{u_{k}\right\} \subset C^{1}\left(B^{n}, \mathcal{Y}\right)$ such that $G_{u_{k}} \rightharpoonup T$ weakly in $\mathcal{D}_{n, 1}\left(B^{n} \times \mathcal{Y}\right)$ we have that

$$
\liminf _{k \rightarrow \infty} \int_{B^{n}} f\left(x, u, D u_{k}\right) d x \geq \mathcal{F}_{f}(T)+C
$$

for some absolute constant $C>0$. This means that in general $\mathcal{F}_{f}(T)$ does not agree with the relaxed energy functional of $T$ :

$$
\begin{array}{r}
\mathcal{F}_{f}(T)>\inf \left\{\liminf _{k \rightarrow \infty} \int_{B^{n}} f\left(x, u_{k}, D u_{k}\right) d x \mid\left\{u_{k}\right\} \subset C^{1}\left(B^{n}, \mathcal{Y}\right)\right. \\
\left.G_{u_{k}} \rightharpoonup T \quad \text { weakly in } \mathcal{Z}_{n, 1}\left(B^{n} \times \mathcal{Y}\right)\right\}
\end{array}
$$

Remark 2.7 This gap phenomenon is typical of integrands with linear growth of the gradient. Take for example $n=1$ and $T=G_{u}+\delta_{0} \times C$, where $u \equiv P \in \mathcal{Y}$ is a constant map and $C$ is a integral 1-cycle in $\mathcal{Y}$. The images of smooth approximating sequences may have to "connect" the point $P$ to the cycle $C$, this way paying a cost in term of the distance of $P$ to $C$, see (3.4) and (3.5) below. For this reason, such a gap phenomenon does not occur if the target manifold $\mathcal{Y}$ is the unit sphere $\mathbb{S}^{1}$.

## 3 Cartesian currents with finite energy

The gap phenomenon previously outlined leads us to introduce a suitable energy functional on the class of currents $\mathcal{E}_{1,1}-\operatorname{graph}\left(B^{n} \times \mathcal{Y}\right)$. In order to recover lower semicontinuity and density properties, we shall restrict the class of integrands. More precisely, in the sequel we shall consider functions $\widetilde{f}: B^{n} \times \mathbb{R}^{N} \times \mathbb{R}_{+}^{N} \rightarrow$ $\mathbb{R}_{+}$satisfying the following properties:
(a) $z \mapsto \widetilde{f}(x, u, z)$ is convex and lower semicontinuous in $\mathbb{R}_{+}^{N}$ for every $(x, u) \in B^{n} \times \mathbb{R}^{N}$;
(b) $C_{1}|z| \leq \widetilde{f}(x, u, z) \leq C_{2}(1+|z|)$ for every $(x, u, z) \in B^{n} \times \mathbb{R}^{N} \times \mathbb{R}_{+}^{N}$ and some absolute constants $C_{i}>0$;
(c) for every $u \in \mathbb{R}^{N}$ there exists a continuous function $\omega_{u}: \mathbb{R}_{+} \rightarrow \mathbb{R}_{+}$satisfying $\omega_{u}(t) \rightarrow 0$ if $t \rightarrow 0$, and depending continuously on $u \in \mathbb{R}^{N}$, such that

$$
\left|\widetilde{f}(x, u, z)-\widetilde{f}\left(x_{0}, u, z\right)\right| \leq \omega_{u}\left(x-x_{0}\right) \cdot(1+|z|) \quad \forall z \in \mathbb{R}_{+}^{N}
$$

For any matrix $G=\left(G_{i}^{j}\right)_{j, i=1}^{N, n} \in M(N, n)$, we denote by $G^{j}:=\left(G_{1}^{j}, \ldots, G_{n}^{j}\right) \in \mathbb{R}^{n}$ the $n$-vector corresponding to the $j^{\text {th }}$-row. The corresponding integrand $f: B^{n} \times \mathbb{R}^{N} \times M(N, n) \rightarrow \mathbb{R}_{+}$is defined by

$$
\begin{equation*}
f(x, u, G):=\widetilde{f}\left(x, u,\left(\left|G^{1}\right|, \ldots,\left|G^{N}\right|\right)\right), \quad(x, u, G) \in B^{n} \times \mathbb{R}^{N} \times M(N, n) \tag{3.1}
\end{equation*}
$$

the isotropic case corresponding to $\tilde{f}(x, u, z)=\widehat{f}(x, u,|z|)$ for some $\widehat{f}: B^{n} \times \mathbb{R}^{N} \times \mathbb{R}_{+} \rightarrow \mathbb{R}_{+}$. Therefore, the related variational functional $\mathcal{F}(u)$, see (0.1), is such that for any smooth map $u=\left(u^{1}, \ldots, u^{N}\right) \in C^{1}\left(B^{n}, \mathcal{Y}\right)$

$$
\mathcal{F}(u)=\int_{B^{n}} \widetilde{f}\left(x, u(x),\left(\left|D u^{1}(x)\right|, \ldots,\left|D u^{1}(x)\right|\right)\right) d x
$$

Remark 3.1 Since $f(x, u, G)$ is convex and lower semicontinuous in $G$ for every $(x, u) \in B^{n} \times \mathbb{R}^{N}$, it satisfies the properties (a), (b), (c) stated at the beginning of the previous section. We notice that the continuity hypothesis (c) is used in the proof of the density theorem 5.1.

We now collect the following facts from [12], see also [13].
JUMP-CONCENTRATION SET. Let $T \in \mathcal{E}_{1,1}-\operatorname{graph}\left(B^{n} \times \mathcal{Y}\right)$, see Definition 1.7. If $\mathcal{L}(T)$ denotes the $(n-1)$-rectifiable set given by the union of the sets of positive multiplicity of the $\mathbb{L}_{s}(T)$ 's, we infer that the union

$$
J_{c}(T):=J_{u_{T}} \cup \mathcal{L}(T)
$$

does not depend on the choice of the representative in $T$. The countably $\mathcal{H}^{n-1}$-rectifiable set $J_{c}(T)$ is said to be the set of points of jump-concentration of $T$.

RESTRICTION OVER POINTS OF JUMP-CONCENTRATION. If $n=1$, since $T$ has finite mass, $\eta \mapsto T\left(\chi_{B_{r}(x)} \wedge \eta\right)$, where $x \in B^{1}$ and $0<r<1-|x|$, defines a current in $\mathcal{D}_{1}(\mathcal{Y})$. The 1-dimensional restriction of $T$ over the point $x$

$$
\widehat{\pi}_{\#}\left(T\llcorner\{x\} \times \mathcal{Y}) \in \mathcal{D}_{1}(\mathcal{Y})\right.
$$

is well-defined on closed 1-forms in $\mathcal{Z}^{1}(\mathcal{Y})$ by the limit

$$
\widehat{\pi}_{\#}\left(T\llcorner\{x\} \times \mathcal{Y})(\eta):=\lim _{r \rightarrow 0^{+}} T\left(\chi_{B_{r}(x)} \wedge \eta\right), \quad \eta \in \mathcal{Z}^{1}(\mathcal{Y})\right.
$$

Moreover, for every $x \in J_{c}(T)$ there exists a 1-dimensional integral chain $\Gamma_{x}$ on $\mathcal{Y}$ such that

$$
\partial \Gamma_{x}=\delta_{u_{T}^{+}(x)}-\delta_{u_{T}^{-}(x)} \quad \text { and } \quad \widehat{\pi}_{\#}\left(T\llcorner\{x\} \times \mathcal{Y})=\Gamma_{x}\right.
$$

Therefore, by applying Federer's decomposition theorem [6], we find an indecomposable 1-dimensional integral chain $\gamma_{x}$ on $\mathcal{Y}$, satisfying $\partial \gamma_{x}=\delta_{u_{T}^{+}(x)}-\delta_{u_{T}^{-}(x)}$, and an integral 1-cycle $C_{x}$ in $\mathcal{Y}$, satisfying $\partial C_{x}=0$, such that

$$
\begin{equation*}
\Gamma_{x}=\gamma_{x}+C_{x} \quad \text { and } \quad \mathbf{M}\left(\Gamma_{x}\right)=\mathbf{M}\left(\gamma_{x}\right)+\mathbf{M}\left(C_{x}\right) \tag{3.2}
\end{equation*}
$$

If $n \geq 2$, we let $\nu_{T}: J_{c}(T) \rightarrow \mathbb{S}^{n-1}$ denote an extension to $J_{c}(T)$ of the unit normal $\nu_{u_{T}}$ to the Jump set $J_{u_{T}}$. For any $k=1, \ldots, n-1$, let $P$ be an oriented $k$-dimensional subspace in $\mathbb{R}^{n}$ and $P_{\lambda}:=P+\sum_{i=1}^{n-k} \lambda_{i} \nu_{i}$ the family of oriented $k$-planes parallel to $P$, where $\lambda:=\left(\lambda_{1}, \ldots, \lambda_{n-k}\right) \in \mathbb{R}^{n-k}, \operatorname{span}\left(\nu_{1}, \ldots, \nu_{n-k}\right)$ being the orthogonal space to $P$. Since $T$ has finite $\mathcal{E}_{1,1}$-norm, similarly to the case of normal currents, for $\mathcal{L}^{n-k}{ }_{-}$ a.e. $\lambda$ such that $P_{\lambda} \cap B^{n} \neq \emptyset$, the slice $T\left\llcorner\pi^{-1}\left(P_{\lambda}\right)\right.$ of $T$ over $\pi^{-1}\left(P_{\lambda}\right)$ is a well defined $k$-dimensional current in $\mathcal{E}_{1,1}-\operatorname{graph}\left(\left(B^{n} \cap P_{\lambda}\right) \times \mathcal{Y}\right)$ with finite $\mathcal{E}_{1,1}$-norm. Moreover, for any such $\lambda$ we have

$$
J_{c}\left(T\left\llcorner\pi^{-1}\left(P_{\lambda}\right)\right)=J_{c}(T) \cap P_{\lambda} \quad \text { in the } \mathcal{H}^{k-1}\right. \text {-a.e. sense }
$$

whereas the $B V$-function associated to $T\left\llcorner\pi^{-1}\left(P_{\lambda}\right)\right.$ is equal to the restriction $u_{T \mid P_{\lambda}}$ of $u_{T}$ to $P_{\lambda}$. Therefore, in the particular case $k=1$, the 1-dimensional restriction

$$
\begin{equation*}
\widehat{\pi}_{\#}\left(\left(T\left\llcorner\pi^{-1}\left(P_{\lambda}\right)\right)\llcorner\{x\} \times \mathcal{Y}) \in \mathcal{D}_{1}(\mathcal{Y})\right.\right. \tag{3.3}
\end{equation*}
$$

of the 1-dimensional current $T\left\llcorner\pi^{-1}\left(P_{\lambda}\right)\right.$ over any point $x \in J_{c}(T) \cap P_{\lambda}$ such that $\nu_{T}(x)$ does not belong to $P$ is well defined. In this case, from the slicing properties of $B V$-functions, if $x \in\left(J_{c}(T) \backslash J_{u_{T}}\right) \cap P_{\lambda}$ we have $u_{T \mid P_{\lambda}}(x)=u_{T}(x)$. Moreover, if $x \in J_{u_{T}} \cap P_{\lambda}$, the one-sided approximate limits of $u_{T}$ are equal to the one-sided limits of the restriction $u_{T \mid P_{\lambda}}$, i.e.

$$
u_{T \mid P_{\lambda}}^{+}(x)=u_{T}^{+}(x) \quad \text { and } \quad u_{T \mid P_{\lambda}}^{-}(x)=u_{T}^{-}(x),
$$

provided that $\left\langle\nu, \nu_{u_{T}}(x)\right\rangle>0$, where $\nu$ is an orienting unit vector to $P$, compare Theorem 1.2. We finally infer that for $\mathcal{H}^{n-1}$-a.e. point $x \in J_{c}(T)$ the 1-dimensional restriction (3.3), up to the orientation, does not depend on the choice of the oriented 1-space $P$ and on $\lambda \in \mathbb{R}^{n-1}$, provided that $x \in P_{\lambda}$ and $\nu_{T}(x)$ does not belong to $P$. As a consequence we may and do give the following

Definition 3.2 For $\mathcal{H}^{n-1}$-a.e. point $x \in J_{c}(T)$, the 1-dimensional restriction $\widehat{\pi}_{\#}(T\llcorner\{x\} \times \mathcal{Y})$ is welldefined by (3.3) for any oriented 1-space $P$ and $\lambda \in \mathbb{R}^{n-1}$ such that $x \in P_{\lambda}$ and $\left\langle\nu, \nu_{T}(x)\right\rangle>0$, where $\nu$ is the orienting unit vector to $P$.

VERTICAL MINIMAL CONNECTION. For every current $T \in \mathcal{E}_{1,1}-\operatorname{graph}\left(B^{n} \times \mathcal{Y}\right)$ and every point $x \in J_{c}(T)$ we will denote by

$$
\begin{aligned}
\Gamma_{T}(x):=\{ & \gamma \in \operatorname{Lip}([0,1], \mathcal{Y}) \mid \\
& \gamma(0)=u_{T}^{-}(x), \quad \gamma(1)=u_{T}^{+}(x), \\
& \gamma_{\#} \llbracket(0,1) \rrbracket(\eta)=\widehat{\pi}_{\#}\left(T\llcorner\{x\} \times \mathcal{Y})(\eta) \quad \forall \eta \in \mathcal{Z}^{1}(\mathcal{Y})\right\}
\end{aligned}
$$

the family of all smooth curves $\gamma$ in $\mathcal{Y}$, with end points $u_{T}^{ \pm}(x)$, such that their image current $\gamma_{\#} \llbracket(0,1) \rrbracket$ agrees with the 1-dimensional restriction $\widehat{\pi}_{\#}\left(T\llcorner\{x\} \times \mathcal{Y})\right.$ on closed 1-forms in $\mathcal{Z}^{1}(\mathcal{Y})$. On account of (2.6), to every $\gamma \in \Gamma_{T}(x)$, say $\gamma=\left(\gamma^{1}, \ldots, \gamma^{N}\right)$, we associate the parametric integrand

$$
\begin{equation*}
\mathcal{L}_{f, x}(\gamma):=\int_{0}^{1} \widetilde{f}^{\infty}\left(x, \gamma(t),\left(\left|\dot{\gamma}^{1}(t)\right|, \ldots,\left|\dot{\gamma}^{N}(t)\right|\right)\right) d t \tag{3.4}
\end{equation*}
$$

It turns out that $\mathcal{L}_{f, x}(\gamma)$ does not depend on the parameterization of $\gamma$. Moreover, we denote by

$$
\begin{equation*}
f_{T}(x):=\inf \left\{\mathcal{L}_{f, x}(\gamma) \mid \gamma \in \Gamma_{T}(x)\right\}, \quad x \in J_{c}(T) \tag{3.5}
\end{equation*}
$$

the minimal "length" of curves $\gamma$ connecting the "vertical part" of $T$ over $x$ to the graph of $u_{T}$. For future use, we remark that the infimum in (3.5) is attained, i.e.,

$$
\begin{equation*}
\forall x \in J_{c}(T), \quad \exists \gamma \in \Gamma_{T}(x) \quad: \quad \mathcal{L}_{f, x}(\gamma)=f_{T}(x) \tag{3.6}
\end{equation*}
$$

Remark 3.3 In the model case $f(x, u, G):=|G|$, or $f(x, u, G):=\sqrt{1+|G|^{2}}$, we have $f^{\infty}(x, u, G)=|G|$ and hence $\mathcal{L}_{f, x}(\gamma)$ agrees with the standard length $\mathcal{L}(\gamma)$ of the curve $\gamma$. Therefore, in this case we have

$$
\begin{equation*}
f_{T}(x)=\mathcal{L}_{T}(x):=\inf \left\{\mathcal{L}(\gamma) \mid \gamma \in \Gamma_{T}(x)\right\}, \quad x \in J_{c}(T) \tag{3.7}
\end{equation*}
$$

The EnERGY. To any current $T \in \mathcal{E}_{1,1}-\operatorname{graph}\left(B^{n} \times \mathcal{Y}\right)$ we associate its $f$-energy given for every Borel set $B \subset B^{n}$ by

$$
\begin{align*}
\mathcal{E}_{f}(T, B \times \mathcal{Y}) & :=\int_{B} f\left(x, u_{T}(x), \nabla u_{T}(x)\right) d x+\int_{B} f^{\infty}\left(x, u_{T}^{+}(x), \frac{d D^{C} u_{T}}{d\left|D^{C} u_{T}\right|}(x)\right) d\left|D^{C} u_{T}\right|  \tag{3.8}\\
& +\int_{J_{c}(T) \cap B} f_{T}(x) d \mathcal{H}^{n-1}(x)
\end{align*}
$$

We also let

$$
\mathcal{E}_{f}(T):=\mathcal{E}_{f}\left(T, B^{n} \times \mathcal{Y}\right)
$$

Moreover, if $u: B^{n} \rightarrow \mathcal{Y}$ is a smooth $W^{1,1}$-function, we set

$$
\mathcal{E}_{f}(u):=\int_{B^{n}} f(x, u, D u) d x=\int_{B^{n}} \widetilde{f}\left(x, u,\left|D u^{1}\right|, \ldots,\left|D u^{N}\right|\right) d x
$$

Remark 3.4 The first two terms in (3.8), corresponding to the "diffuse" part $\nabla u_{T} d x+D^{C} u_{T}$ of $D u_{T}$, agree with the corresponding terms of the parametric variational energy $\mathcal{F}_{f}(T)$, see (2.7). Moreover, in the case $\mathcal{Y}=\mathbb{S}^{1}$, the unit sphere, it can be readily checked that

$$
\mathcal{E}_{f}(T)=\mathcal{F}_{f}(T) \quad \forall T \in \mathcal{E}_{1,1}-\operatorname{graph}\left(B^{n} \times \mathbb{S}^{1}\right)
$$

and if $\mathcal{Y}=\mathbb{S}^{1}$ no gap phenomenon occurs for $\mathcal{F}_{f}(T)$, see Remark 2.7. However, for more general target manifolds $\mathcal{Y}$, the presence of the last term in (3.8) yields that $\mathcal{E}_{f}(T)$ is not a "local" energy, i.e., it cannot be written as an integral functional depending on the components $\vec{T}$ and $\|T\|_{\mathcal{E}_{1,1}}$ of the decomposition $T=\|T\|_{\mathcal{E}_{1,1}}\llcorner\vec{T}$, as in (2.6).

Due to (3.1), the volume term in the definition of $\mathcal{E}_{f}(T, B \times \mathcal{Y})$ is

$$
\int_{B} f\left(x, u_{T}, \nabla u_{T}\right) d x=\int_{B} \widetilde{f}\left(x, u_{T},\left(\left|\nabla u_{T}^{1}\right|, \ldots,\left|\nabla u_{T}^{N}\right|\right)\right) d x
$$

Therefore, if $T=G_{u}$ for some smooth function $u \in W^{1,1}\left(B^{n}, \mathcal{Y}\right)$, we have

$$
\mathcal{E}_{f}\left(G_{u}\right)=\mathcal{E}_{f}(u)
$$

As to the Cantor-type term, since $f^{\infty}(x, u, G)=\widetilde{f}^{\infty}\left(x, u,\left(\left|G^{1}\right|, \ldots,\left|G^{N}\right|\right)\right)$, it turns out that

$$
\int_{B} f^{\infty}\left(x, u_{T}^{+}, \frac{d D^{C} u_{T}}{d\left|D^{C} u_{T}\right|}\right) d\left|D^{C} u_{T}\right|=\int_{B} \tilde{f}^{\infty}\left(x, u_{T}^{+},\left(\frac{d D^{C} u_{T}^{1}}{d\left|D^{C} u_{T}\right|}, \ldots, \frac{d D^{C} u_{T}^{N}}{d\left|D^{C} u_{T}\right|}\right)\right) d\left|D^{C} u_{T}\right|
$$

Moreover, in the isotropic case $f(x, u, G)=\widehat{f}(x, u,|G|)$, we clearly have

$$
\int_{B} f\left(x, u_{T}, \nabla u_{T}\right) d x=\int_{B} \widehat{f}\left(x, u_{T},\left|\nabla u_{T}\right|\right) d x
$$

and

$$
\int_{B} f^{\infty}\left(x, u_{T}^{+}, \frac{d D^{C} u_{T}}{d\left|D^{C} u_{T}\right|}\right) d\left|D^{C} u_{T}\right|=\int_{B} \widehat{f}^{\infty}\left(x, u_{T}^{+}, 1\right) d\left|D^{C} u_{T}\right|
$$

Remark 3.5 As to the last term in (3.8), the so called "jump-concentration" part, it turns out that in general the "jump" part cannot be separated from the "homological" part. For instance, in the decomposition (1.7) of $T$ we may define the jump part $G_{T}^{J}$ of $G_{T}$ by choosing $\gamma_{x}$ as the 1-current integration over an oriented geodesic arc in $\mathcal{Y}$ connecting $u_{T}^{-}(x)$ and $u_{T}^{+}(x)$, see Definition 1.3. However, even in dimension $n=1$ and in the particular case $\mathcal{Y}=\mathbb{S}^{1}$, in general it may happen that the jump-concentration part of the energy of $T$ cannot be recovered by the sum of the energies of its components $G_{T}^{J}$ and $S_{T}$, see [12].

The case of simply-Connected manifolds. If the first homotopy group $\pi_{1}(\mathcal{Y})$ is trivial, we have $H_{1}(\mathcal{Y})=0$ and hence every current $T \in \mathcal{E}_{1,1}-\operatorname{graph}\left(B^{n} \times \mathcal{Y}\right)$ has no homological vertical part, i.e., $S_{T} \equiv 0$ on $\mathcal{Z}^{n, 1}\left(B^{n} \times \mathcal{Y}\right)$, see (1.7). Therefore, $T$ reduces to the vertical equivalence class of the elements $G \in B V-\operatorname{graph}\left(B^{n} \times \mathcal{Y}\right)$ with corresponding $B V$-function $u(G)$ equal to $u_{T}$, see Definition 1.3. Moreover, for every such current $G$, the action of the jump part $G^{j}$, on forms in $\mathcal{Z}^{n, 1}\left(B^{n} \times \mathcal{Y}\right)$, does not depend on the choice of the integral 1-chain $\gamma_{x}$, but only on the one-sided approximate limits $u_{T}^{ \pm}(x)$.
Remark 3.6 The above facts yield that if $\pi_{1}(\mathcal{Y})=0$, for every $T \in \mathcal{E}_{1,1}-\operatorname{graph}\left(B^{n} \times \mathcal{Y}\right)$ the jumpconcentration set $J_{c}(T)$ agrees with the jump set $J_{u_{T}}$ of $u_{T}$ and for every $x \in J_{u_{T}}$ the 1-dimensional restriction $\widehat{\pi}_{\#}\left(T\llcorner\{x\} \times \mathcal{Y})\right.$, see Definition 3.2, agrees on closed 1-forms in $\mathcal{Z}^{1}(\mathcal{Y})$ with the current integration over any integral 1-chain $\gamma_{x}$ in $\mathcal{Y}$ satisfying $\partial \gamma_{x}=\delta_{u_{T}^{+}(x)}-\delta_{u_{\bar{T}}^{-}(x)}$, see (3.2).

Cartesian currents. In the model case $f(x, u, G)=|G|$, clearly $\mathcal{E}_{f}(T)$ agrees with

$$
\begin{equation*}
\mathcal{E}_{1,1}(T):=\int_{B^{n}}\left|\nabla u_{T}\right| d x+\left|D^{C} u_{T}\right|\left(B^{n}\right)+\int_{J_{c}(T)} \mathcal{L}_{T}(x) d \mathcal{H}^{n-1}(x), \tag{3.9}
\end{equation*}
$$

the $B V$-energy of $T$, see [12]. Notice that by property (b) we infer that for any $T \in \mathcal{E}_{1,1}-\operatorname{graph}\left(B^{n} \times \mathcal{Y}\right)$

$$
\begin{equation*}
\mathcal{E}_{f}(T)<\infty \quad \Longleftrightarrow \quad \mathcal{E}_{1,1}(T)<\infty \tag{3.10}
\end{equation*}
$$

Definition 3.7 We denote by $\operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$ the class of currents $T$ in $\mathcal{E}_{1,1}-\operatorname{graph}\left(B^{n} \times \mathcal{Y}\right)$ such that $\mathcal{E}_{1,1}(T)<\infty$.
For example, if $u \in W^{1,1}\left(B^{n}, \mathcal{Y}\right)$ the current $G_{u}$ carried by the graph of $u$, see (1.3), belongs to cart ${ }^{1,1}\left(B^{n} \times\right.$ $\mathcal{Y}$ ) if and only if

$$
\begin{equation*}
\partial G_{u}(\omega)=0 \quad \forall \omega \in \mathcal{Z}^{n-1,1}\left(B^{n} \times \mathcal{Y}\right) . \tag{3.11}
\end{equation*}
$$

The previous definitions are motivated by the following lower semicontinuity property, compare [12].
Theorem 3.8 Let $n \geq 1$ and $T \in \operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$. For every sequence of smooth maps $\left\{u_{k}\right\} \subset C^{1}\left(B^{n}, \mathcal{Y}\right)$ such that $G_{u_{k}} \rightharpoonup T$ weakly in $\mathcal{Z}_{n, 1}\left(B^{n} \times \mathcal{Y}\right)$, we have

$$
\liminf _{k \rightarrow \infty} \mathcal{E}_{1,1}\left(u_{k}\right) \geq \mathcal{E}_{1,1}(T), \quad \mathcal{E}_{1,1}\left(u_{k}\right):=\int_{B^{n}}\left|D u_{k}\right| d x .
$$

In addition, if we assume that the first homotopy group $\pi_{1}(\mathcal{Y})$ is commutative, the following density result holds true, see [12].

Theorem 3.9 Let $T \in \operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$. There exists a sequence of smooth maps $\left\{u_{k}\right\} \subset C^{1}\left(B^{n}, \mathcal{Y}\right)$ such that $G_{u_{k}} \rightharpoonup T$ weakly in $\mathcal{Z}_{n, 1}\left(B^{n} \times \mathcal{Y}\right)$ and $\mathcal{E}_{1,1}\left(u_{k}\right) \rightarrow \mathcal{E}_{1,1}(T)$ as $k \rightarrow \infty$.

Properties. As a consequence, we also obtain:
i) the functional $T \mapsto \mathcal{E}_{1,1}(T)$ is lower semicontinuous on cart $^{1,1}\left(B^{n} \times \mathcal{Y}\right)$ with respect to the weak $\mathcal{Z}_{n, 1 \text {-convergence; }}$
ii) the class of Cartesian currents $\operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$ is closed under the weak $\mathcal{Z}_{n, 1}$-convergence with equibounded energies;
iii) $\mathcal{E}_{1,1}$-bounded sequences in $\operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$ are relatively compact in the $\mathcal{Z}_{n, 1}$-topology.

## 4 Lower semicontinuity of the energy

In this section we consider integrands $f(x, u, G)$ of the type (3.1) for some function $\widetilde{f}: B^{n} \times \mathbb{R}^{N} \times \mathbb{R}_{+}^{N} \rightarrow \mathbb{R}_{+}$ satisfying the properties (a), (b), (c) of the previous section. We shall prove that the energy functional $T \mapsto \mathcal{E}_{f}(T)$ defined by (3.8) is lower semicontinuous in $\operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$ along smooth sequences.

Theorem 4.1 Let $T \in \operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$. For every sequence of smooth maps $\left\{u_{k}\right\} \subset C^{1}\left(B^{n}, \mathcal{Y}\right)$ such that $G_{u_{k}} \rightharpoonup T$ weakly in $\mathcal{Z}_{n, 1}\left(B^{n} \times \mathcal{Y}\right)$, we have

$$
\liminf _{k \rightarrow \infty} \mathcal{E}_{f}\left(u_{k}\right) \geq \mathcal{E}_{f}(T)
$$

The proof follows the lines of the one given in [12] in the case $f(x, u, G)=|G|$, see Theorem 3.8. More precisely, we shall first prove Theorem 4.1 in the case of dimension $n=1$. Secondly, applying arguments as for instance in [7], we shall deal with the case of higher dimension $n \geq 2$.

Remark 4.2 Theorem 4.1 continues to hold if we weaken the continuity assumption (c) by requiring an upper semicontinuity property similar to the one in property (c) from Sec. 2.

Proof of Theorem 4.1 (The case $n=1$ ): We follow line by line the proof given in [12], taking into account the following facts and modifications:
i) We have $T=G_{T}+S_{T}$, where $G_{T} \in B V-\operatorname{graph}\left(B^{1} \times \mathcal{Y}\right)$ and

$$
S_{T}=\sum_{i=1}^{I} \delta_{x_{i}} \times C_{i} \quad \text { on } \quad \mathcal{Z}^{1,1}\left(B^{1} \times \mathcal{Y}\right)
$$

$\left\{x_{i}: i=1, \ldots, I\right\}$ being a finite disjoint set of points in $B^{1}$, possibly intersecting the Jump set $J_{u_{T}}$, and $C_{i}$ is a homologically non-trivial integral 1-cycle in $\mathcal{Y}$.
ii) If $\left\{x_{i}\right\}_{i>I} \subset B^{1}$ is the at most countable set of discontinuity points in $J_{u_{T}} \backslash\left\{x_{i}: i=1, \ldots, I\right\}$, by the properties of $\mathcal{Y}$ we have

$$
\mathcal{L}_{T}\left(x_{i}\right) \leq C \cdot\left|u_{T}^{+}\left(x_{i}\right)-u_{T}^{-}\left(x_{i}\right)\right| \quad \forall i>I
$$

where $C=C(\mathcal{Y})>0$ is an absolute constant, see (3.7). Now, property (b) yields

$$
C_{1}|\dot{\gamma}(t)| \leq \widetilde{f}^{\infty}\left(x, \gamma(t),\left(\left|\dot{\gamma}^{1}(t)\right|, \ldots,\left|\dot{\gamma}^{N}(t)\right|\right)\right) \leq C_{2}|\dot{\gamma}(t)|
$$

and hence

$$
\begin{equation*}
C_{1} \mathcal{L}(\gamma) \leq \mathcal{L}_{f, x}(\gamma) \leq C_{2} \mathcal{L}(\gamma) \tag{4.1}
\end{equation*}
$$

for every $\gamma \in \Gamma_{T}(x)$ and $x \in J_{c}(T)$. Therefore, for every $\varepsilon>0$ we find again $l(\varepsilon)>I$ such that

$$
\begin{equation*}
\sum_{i=l(\varepsilon)+1}^{\infty} f_{T}\left(x_{i}\right)<\varepsilon \tag{4.2}
\end{equation*}
$$

iii) If $\left\{\widetilde{\gamma}_{k}^{i}\right\}_{k}$ is a sequence of Lipschitz $\operatorname{arcs} \widetilde{\gamma}_{k}^{i}:[0,1] \rightarrow \mathcal{Y}$ uniformly converging to a Lipschitz arc $\widetilde{\gamma}^{i} \in \Gamma_{T}\left(x_{i}\right)$, by lower semicontinuity of the functional w.r.t. the uniform convergence, we have

$$
\mathcal{L}_{f, x_{i}}\left(\widetilde{\gamma}^{i}\right) \leq \liminf _{k \rightarrow \infty} \mathcal{L}_{f, x_{i}}\left(\widetilde{\gamma}_{k}^{i}\right)
$$

By (3.5) we thus conclude again that

$$
f_{T}\left(x_{i}\right) \leq \liminf _{k \rightarrow \infty} \mathcal{L}_{f, x_{i}}\left(\gamma_{k}^{i}\right) \quad \forall i=1, \ldots, l(\varepsilon)
$$

where $\gamma_{k}^{i}:[0,1] \rightarrow \mathcal{Y}$ is the Lipschitz reparametrization with constant velocity of $u_{k \mid\left[a_{k}^{i}, b_{k}^{i}\right]}$.
iv) By lower semicontinuity, due to the weak $B V$-convergence of $u_{k} \rightharpoonup u_{T}$ we have

$$
\int_{B^{1}} f\left(x, u_{T}, \nabla u_{T}\right) d x+\int_{B^{1}} f^{\infty}\left(x, u_{T}^{+}, \frac{d D^{C} u_{T}}{d\left|D^{C} u_{T}\right|}\right) d\left|D^{C} u_{T}\right| \leq \liminf _{k \rightarrow \infty} \int_{B^{1}} f\left(x, u_{k}, D u_{k}\right) d x
$$

We finally obtain

$$
\mathcal{E}_{f}(T)-\varepsilon \leq \liminf _{k \rightarrow \infty} \int_{B^{1}} f\left(x, u_{k}, D u_{k}\right) d x
$$

and hence the assertion, by letting $\varepsilon \searrow 0$.
To prove Theorem 4.1 in the higher dimension $n \geq 2$, we shall need the following property.
One-Dimensional restrictions of Cartesian currents. If $T \in \operatorname{cart}^{1,1}\left(B^{n}, \mathcal{Y}\right)$, for any $\nu \in \mathbb{S}^{n-1}$ the 1-dimensional slice

$$
T_{y}^{\nu}:=T\left\llcorner\left(B^{n}\right)_{y}^{\nu} \times \mathcal{Y}\right.
$$

defines a Cartesian current $T_{y}^{\nu} \in \operatorname{cart}^{1,1}\left(\left(B^{n}\right)_{y}^{\nu} \times \mathcal{Y}\right)$ for $\mathcal{L}^{n-1}$-a.e. $y \in\left(B^{n}\right)_{\nu}$. By Theorem 1.2 and by the definition (3.8), on account of (3.1) we infer that the $f$-energy of $T_{y}^{\nu}$ is given for $\mathcal{L}^{n-1}$-a.e. $y \in\left(B^{n}\right)_{\nu}$ by

$$
\begin{align*}
\mathcal{E}_{f}\left(T_{y}^{\nu}, A_{y}^{\nu} \times \mathcal{Y}\right) & =\int_{A_{y}^{\nu}} \widetilde{f}\left(x, u_{T}(y+t \nu),\left(\left|\left\langle\nabla u_{T}^{1}(y+t \nu), \nu\right\rangle\right|, \ldots,\left|\left\langle\nabla u_{T}^{N}(y+t \nu), \nu\right\rangle\right|\right)\right) d t \\
& +\int_{A_{y}^{\nu}} \widetilde{f}^{\infty}\left(x, u_{T}^{+},\left(\frac{d D^{C}\left(u_{T}^{1}\right)_{y}^{\nu}}{d\left|D^{C}\left(u_{T}\right)_{y}^{\nu}\right|}, \ldots, \frac{d D^{C}\left(u_{T}^{N}\right)_{y}^{\nu}}{d\left|D^{C}\left(u_{T}\right)_{y}^{\nu}\right|}\right)\right) d\left|D^{C}\left(u_{T}\right)_{y}^{\nu}\right|  \tag{4.3}\\
& +\sum_{t \in\left(J_{c}(T) \cap A\right)_{y}^{\nu}} f_{T}(y+t \nu)
\end{align*}
$$

for any open set $A \subset B^{n}$.
Proof of Theorem 4.1 (The case $n \geq 2$ ): We modify the proof given in [12] in the case $f(x, u, G)=|G|$, where we followed [3, Thm. 5.4]. Since $\left\{u_{k}\right\} \subset C^{1}\left(B^{n}, \mathcal{Y}\right)$ is such that $G_{u_{k}} \rightharpoonup T$ weakly in $\mathcal{Z}_{n, 1}\left(B^{n} \times \mathcal{Y}\right)$, for $\mathcal{L}^{n-1}$-a.e. $y \in\left(B^{n}\right)_{\nu}$ we infer that

$$
\left(G_{u_{k}}\right)_{y}^{\nu} \rightharpoonup T_{y}^{\nu} \quad \text { weakly in } \quad \mathcal{Z}_{1,1}\left(\left(B^{n}\right)_{y}^{\nu} \times \mathcal{Y}\right)
$$

where

$$
\left(G_{u_{k}}\right)_{y}^{\nu}=G_{\left(u_{k}\right)_{y}^{\nu}}, \quad\left(u_{k}\right)_{y}^{\nu}(t):=u_{k}(y+t \nu) \in C^{1}\left(\left(B^{n}\right)_{y}^{\nu}, \mathcal{Y}\right)
$$

Therefore, by the case $n=1$ we infer that

$$
\mathcal{E}_{f}\left(T_{y}^{\nu}, A_{y}^{\nu} \times \mathcal{Y}\right) \leq \liminf _{k \rightarrow \infty} \mathcal{E}_{f}\left(\left(u_{k}\right)_{y}^{\nu}, A_{y}^{\nu}\right)
$$

for any open set $A \subset B^{n}$, where

$$
\mathcal{E}_{f}\left(\left(u_{k}\right)_{y}^{\nu}, A_{y}^{\nu}\right):=\mathcal{E}_{f}\left(G_{\left(u_{k}\right)_{y}^{\nu}}, A_{y}^{\nu} \times \mathcal{Y}\right)=\int_{A_{y}^{\nu}} f\left(x, u_{k}(y+t \nu),\left\langle\nabla u_{k}(y+t \nu), \nu\right\rangle\right) d t
$$

Denote by $\nu_{T}$ an extension to the countably $\mathcal{H}^{n-1}$-rectifiable set $J_{c}(T)$ of the outward unit normal to the Jump set $J_{u_{T}}$. We now define, for every open set $A \subset B^{n}$ and $\nu \in \mathbb{S}^{n-1}$,

$$
\mathcal{E}_{f}(T, A \times \mathcal{Y}, \nu):=\mathcal{E}_{f}^{a}(T, A \times \mathcal{Y}, \nu)+\mathcal{E}_{f}^{C}(T, A \times \mathcal{Y}, \nu)+\mathcal{E}_{f}^{J c}(T, A \times \mathcal{Y}, \nu)
$$

where

$$
\begin{aligned}
\mathcal{E}_{f}^{a}(T, A \times \mathcal{Y}, \nu) & :=\int_{A} \widetilde{f}\left(x, u_{T},\left(\left|\left\langle\nabla u_{T}^{1}, \nu\right\rangle\right|, \ldots,\left|\left\langle\nabla u_{T}^{N}, \nu\right\rangle\right|\right)\right) d x \\
\mathcal{E}_{f}^{C}(T, A \times \mathcal{Y}, \nu) & :=\int_{A} \widetilde{f}^{\infty}\left(x, u_{T}^{+},\left(\frac{d\left\langle D^{C} u_{T}^{1}, \nu\right\rangle}{d\left|\left\langle D^{C} u_{T}, \nu\right\rangle\right|}, \ldots, \frac{d\left\langle D^{C} u_{T}^{N}, \nu\right\rangle}{d\left|\left\langle D^{C} u_{T}, \nu\right\rangle\right|}\right)\right) d\left|\left\langle D^{C} u_{T}, \nu\right\rangle\right| \\
\mathcal{E}_{f}^{J_{c}}(T, A \times \mathcal{Y}, \nu) & :=\int_{J_{c}(T) \cap A}\left|\left\langle\nu_{T}(x), \nu\right\rangle\right| f_{T}(x) d \mathcal{H}^{n-1}(x)
\end{aligned}
$$

By the coarea formula we have

$$
\mathcal{E}_{f}^{J_{c}}(T, A \times \mathcal{Y}, \nu)=\int_{\pi_{\nu}}\left(\sum_{t \in\left(J_{c}(T) \cap A\right)_{y}^{\nu}} f_{T}(y+t \nu)\right) d \mathcal{L}^{n-1}(y)
$$

Moreover, Theorem 1.2 gives

$$
\mathcal{E}_{f}^{a}(T, A \times \mathcal{Y}, \nu)=\int_{\pi_{\nu}}\left(\int_{A_{y}^{\nu}} \widetilde{f}\left(x, u_{T}(y+t \nu),\left(\left|\left\langle\nabla u_{T}^{1}(y+t \nu), \nu\right\rangle\right|, \ldots,\left|\left\langle\nabla u_{T}^{N}(y+t \nu), \nu\right\rangle\right|\right)\right) d t\right) \mathcal{L}^{n-1}(y)
$$

and

$$
\mathcal{E}_{f}^{C}(T, A \times \mathcal{Y}, \nu)=\int_{\pi_{\nu}}\left(\int_{A_{y}^{\nu}} \tilde{f}^{\infty}\left(x, u_{T}^{+},\left(\frac{d D^{C}\left(u_{T}^{1}\right)_{y}^{\nu}}{d\left|D^{C}\left(u_{T}\right)_{y}^{\nu}\right|}, \ldots, \frac{d D^{C}\left(u_{T}^{N}\right)_{y}^{\nu}}{d\left|D^{C}\left(u_{T}\right)_{y}^{\nu}\right|}\right)\right) d\left|D^{C}\left(u_{T}\right)_{y}^{\nu}\right|\right) d \mathcal{L}^{n-1}(y) .
$$

By (4.3) we thus obtain the identity

$$
\begin{equation*}
\mathcal{E}_{f}(T, A \times \mathcal{Y}, \nu)=\int_{\pi_{\nu}} \mathcal{E}_{f}\left(T_{y}^{\nu}, A_{y}^{\nu} \times \mathcal{Y}\right) d \mathcal{L}^{n-1}(y) \tag{4.4}
\end{equation*}
$$

Similarly, setting for every $k$

$$
\mathcal{E}_{f}\left(u_{k}, A, \nu\right):=\int_{A} \widetilde{f}\left(x, u_{k},\left(\left|\left\langle\nabla u_{k}^{1}, \nu\right\rangle\right|, \ldots,\left|\left\langle\nabla u_{k}^{N}, \nu\right\rangle\right|\right)\right) d x
$$

we obtain

$$
\begin{equation*}
\mathcal{E}_{f}\left(u_{k}, A, \nu\right)=\int_{\pi_{\nu}} \mathcal{E}_{f}\left(\left(u_{k}\right)_{y}^{\nu}, A_{y}^{\nu}\right) d \mathcal{L}^{n-1}(y) \tag{4.5}
\end{equation*}
$$

The rest of the proof follows exactly the one in [12] for the case $f(x, u, G)=|G|$, but taking this time $\mathcal{E}_{f}$ instead of $\mathcal{E}_{1,1}$. In particular, we set $\lambda:=\mathcal{L}^{n}+f_{T}(\cdot) \mathcal{H}^{n-1}\left\llcorner J_{c}(T)+\left|D^{C} u_{T}\right|\right.$, choose an $\mathcal{L}^{n}$-negligible set $E \subset B^{n} \backslash J_{c}(T)$ on which $\left|D^{C} u_{T}\right|$ is concentrated, and define

$$
\varphi_{i}(x):= \begin{cases}\widetilde{f}\left(x, u_{T},\left(\left|\left\langle\nabla u_{T}^{1}, \nu_{i}\right\rangle\right|, \ldots,\left|\left\langle\nabla u_{T}^{N}, \nu_{i}\right\rangle\right|\right)\right) & \text { if } \quad x \in B^{n} \backslash\left(E \cup J_{c}(T)\right) \\ \left|\left\langle\nu_{T}(x), \nu_{i}\right\rangle\right| f_{T}(x) & \text { if } \quad x \in J_{c}(T) \\ \widetilde{f}^{\infty}\left(x, u_{T}^{+},\left(\frac{d\left\langle D^{C} u_{T}^{1}, \nu_{i}\right\rangle}{d\left|D^{C} u_{T}\right|}, \ldots, \frac{d\left\langle D^{C} u_{T}^{N}, \nu_{i}\right\rangle}{d\left|D^{C} u_{T}\right|}\right)\right) & \text { if } x \in E\end{cases}
$$

for a countable dense sequence $\left\{\nu_{i}\right\} \subset \mathbb{S}^{n-1}$. The assertion follows, as $\int_{B^{n}} \sup _{i \in \mathbb{N}} \varphi_{i} d \lambda=\mathcal{E}_{f}\left(T, B^{n} \times \mathcal{Y}\right)$.

## 5 Density results for the energy

In this section we shall assume that the first homotopy group $\pi_{1}(\mathcal{Y})$ is commutative and prove the following density result for the energy $\mathcal{E}_{f}(T)$ corresponding to integrands $f$ as in Sec. 3, see Theorem 3.9 for the model case $f(x, u, G)=|G|$, i.e., for the total variation integrand.
Theorem 5.1 Let $T \in \operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$. There exists a sequence of smooth maps $\left\{u_{k}\right\} \subset C^{1}\left(B^{n}, \mathcal{Y}\right)$ such that $G_{u_{k}} \rightharpoonup T$ weakly in $\mathcal{Z}_{n, 1}\left(B^{n} \times \mathcal{Y}\right)$ and $\mathcal{E}_{f}\left(u_{k}\right) \rightarrow \mathcal{E}_{f}(T)$ as $k \rightarrow \infty$.

Remark 5.2 As noticed in [9], in the simple case of $\mathcal{Y}=\mathbb{S}^{1}$, the unit sphere, since the $f$-energy $\mathcal{E}_{f}(T)$ agrees with the parametric variational integral $\mathcal{F}_{f}(T)$, see Remark 3.4 , the continuity theorem by Reshetnyak, see Proposition 5.8 and Theorem 5.9 below, yields at once Theorem 5.1 as consequence of the corresponding theorem in [8] relative to the total variation integrand.
RELAXED FUNCTIONAL. As a consequence of Theorems 4.1 and 5.1, setting

$$
\begin{array}{r}
\widetilde{\mathcal{E}_{f}}(T):=\inf \left\{\liminf _{k \rightarrow \infty} \int_{B^{n}} f\left(x, u_{k}, D u_{k}\right) d x \mid\left\{u_{k}\right\} \subset C^{1}\left(B^{n}, \mathcal{Y}\right),\right.  \tag{5.1}\\
\left.G_{u_{k}} \rightharpoonup T \text { weakly in } \mathcal{Z}_{n, 1}\left(B^{n} \times \mathcal{Y}\right)\right\},
\end{array}
$$

we conclude that

$$
\mathcal{E}_{f}(T)=\widetilde{\mathcal{E}_{f}}(T) \quad \forall T \in \operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)
$$

Properties. By Theorems 4.1 and 5.1 we also infer the following lower semicontinuity property.

Proposition 5.3 Let $\left\{T_{k}\right\} \subset \operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$ converge weakly in $\mathcal{Z}_{n, 1}\left(B^{n} \times \mathcal{Y}\right)$, $T_{k} \rightharpoonup T$, to some $T \in$ $\operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$. Then

$$
\mathcal{E}_{f}(T) \leq \liminf _{k \rightarrow \infty} \mathcal{E}_{f}\left(T_{k}\right)
$$

On account of property (b) and of the sequential closure of $\operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$ under the weak convergence with equibounded $\mathcal{E}_{1,1}$-energies, we also obtain:

Proposition 5.4 Let $\left\{T_{k}\right\} \subset \operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$ converge weakly in $\mathcal{Z}_{n, 1}\left(B^{n} \times \mathcal{Y}\right)$ to some $T \in \mathcal{D}_{n, 1}\left(B^{n} \times \mathcal{Y}\right)$, and $\sup _{k} \mathcal{E}_{f}\left(T_{k}\right)<\infty$. Then $T \in \operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$.

By the relative compactness of $\mathcal{E}_{1,1}$-bounded sequences in cart ${ }^{1,1}\left(B^{n} \times \mathcal{Y}\right)$ in the $\mathcal{Z}_{n, 1}$-topology, we finally infer:

Proposition 5.5 Let $\left\{T_{k}\right\} \subset \operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$ be such that $\sup _{k} \mathcal{E}_{f}\left(T_{k}\right)<\infty$. Then, possibly passing to $a$ subsequence, $T_{k} \rightharpoonup T$ weakly in $\mathcal{Z}_{n, 1}\left(B^{n} \times \mathcal{Y}\right)$ to some $T \in \operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$.

Proof of Theorem 5.1 (The case $n=1$ ): Arguing as in the proof of the lower semicontinuity result, Theorem 4.1, we will adapt our proof from the analogous one of [12], mentioning only the necessary changes. In fact, due to the hypotheses (a), (b), (c), see Sec. 3, arguing e.g. as in Proposition 5.8 below, we may and do apply a mollification procedure to the function $u_{\delta}^{\varepsilon}$, defining this way a smooth map $v_{\delta}^{\varepsilon}: B^{1} \rightarrow \mathbb{R}^{N}$ such that $\left\|v_{\delta}^{\varepsilon}-u_{\delta}^{\varepsilon}\right\|_{L^{1}\left(B^{1}\right)} \leq \delta$ and

$$
\int_{B^{1}} f\left(x, v_{\delta}^{\varepsilon}, D v_{\delta}^{\varepsilon}\right) d x \leq \int_{B^{1}} f\left(x, u_{\delta}^{\varepsilon}, \nabla u_{\delta}^{\varepsilon}\right) d x+\int_{B^{1}} f^{\infty}\left(x,\left(u_{\delta}^{\varepsilon}\right)^{+}, \frac{d D^{s} u_{\delta}^{\varepsilon}}{d\left|D^{s} u_{\delta}^{\varepsilon}\right|}\right) d\left|D^{s} u_{\delta}^{\varepsilon}\right|
$$

where $D^{s} u_{\delta}^{\varepsilon}:=D^{C} u_{\delta}^{\varepsilon}+D^{J} u_{\delta}^{\varepsilon}$. Since $u_{T}$ is continuous outside the Jump set $J_{u_{T}}$ and (4.2) holds true, for every $\sigma>0$ we find again $\eta=\eta(\sigma, \delta, \varepsilon)>0$ such that, in the a.e. sense,

$$
\forall x, y \in B^{1}, \quad|x-y|<\eta \quad \Longrightarrow \quad\left|u_{\delta}^{\varepsilon}(x)-u_{\delta}^{\varepsilon}(y)\right|<\sigma+\varepsilon
$$

As a consequence, we may and do define $v_{\delta}^{\varepsilon}$ in such a way that in particular

$$
\operatorname{dist}\left(v_{\delta}^{\varepsilon}(x), \mathcal{Y}\right)<\varepsilon \quad \forall x \in B^{1}
$$

as required.
Proof of Theorem 5.1 (The case $n \geq 2$ ): Following the proof of Theorem 3.9 for the model case $f(x, u, G)=|G|$, compare [12], we will first prove:

Theorem 5.6 Let $T \in \operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$. We can find a sequence of currents $\left\{T_{k}\right\} \subset \operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$ such that

$$
T_{k} \rightharpoonup T \quad \text { weakly in } \mathcal{Z}_{n, 1}\left(B^{n} \times \mathcal{Y}\right), \quad \mathcal{E}_{f}\left(T_{k}\right) \rightarrow \mathcal{E}_{f}(T)
$$

and the corresponding functions $u_{k}:=u_{T_{k}}$ in $B V\left(B^{n}, \mathcal{Y}\right)$ have no Cantor part, i.e, $\left|D^{C} u_{k}\right|\left(B^{n}\right)=0$ for every $k$. Moreover, $u_{k}$ weakly converges to $u_{T}$ in the $B V$-sense and

$$
\lim _{k \rightarrow \infty}\left|D u_{k}\right|\left(B^{n}\right)=\left|D u_{T}\right|\left(B^{n}\right)
$$

Secondly, we will prove:
Theorem 5.7 Let $T \in \operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$ be such that the corresponding $B V$-function $u_{T} \in B V\left(B^{n}, \mathcal{Y}\right)$ has no Cantor part, i.e., $\left|D^{C} u_{T}\right|=0$. There exists a sequence of smooth maps $\left\{u_{k}\right\} \subset C^{1}\left(B^{n}, \mathcal{Y}\right)$ such that $G_{u_{k}} \rightharpoonup T$ weakly in $\mathcal{Z}_{n, 1}\left(B^{n} \times \mathcal{Y}\right)$ and the energy $\mathcal{E}_{f}\left(u_{k}\right) \rightarrow \mathcal{E}_{f}(T)$ as $k \rightarrow \infty$.

By a diagonal argument we then clearly obtain Theorem 5.1.
We shall recover Theorem 5.6 from the analogous result proved in [12] for the model case $f(x, u, G)=|G|$. To this purpose, we shall make use of the following continuity property from [9, Vol. II].

A CONTINUITY PROPERTY. Denote by $\mathcal{F}_{1,1}(T)$ the parametric variational integral associated to the total variation integral $f(x, u, G):=|G|$, see Sec. 2. According to Remark 2.4 and to (2.5), we have

$$
\mathcal{F}_{1,1}(T):=\int_{B^{n} \times \mathcal{Y}} F_{T V}(\pi(z), \widehat{\pi}(z), \vec{T}(z)) d\|T\|_{\mathcal{E}_{1,1}}(z)
$$

compare (2.6), where for every $(x, u) \in B^{n} \times \mathbb{R}^{N}$

$$
F_{T V}(x, u, \xi):= \begin{cases}\left|\xi_{(1)}\right| & \text { if } u \in \mathcal{Y}, \xi \in \Lambda_{n}\left(\mathbb{R}^{n} \times T_{u} \mathcal{Y}\right) \text { and } \xi^{\overline{0} 0} \geq 0 \\ +\infty & \text { otherwise in } \Lambda_{n} \mathbb{R}^{n+N}\end{cases}
$$

Proposition 5.8 Let $\left\{T_{k}\right\} \subset \mathcal{E}_{1,1}-\operatorname{graph}\left(B^{n} \times \mathcal{Y}\right)$ be such that $T_{k} \rightharpoonup T$ weakly in $\mathcal{Z}_{n, 1}\left(B^{n} \times \mathcal{Y}\right)$ to some $T \in \mathcal{E}_{1,1}-\operatorname{graph}\left(B^{n} \times \mathcal{Y}\right)$. If $\mathcal{F}_{1,1}\left(T_{k}\right) \rightarrow \mathcal{F}_{1,1}(T)$, then $\mathcal{F}_{f}\left(T_{k}\right) \rightarrow \mathcal{F}_{f}(T)$ for every continuous integrand $f$ satisfying the properties (a), (b), (c) of Sec. 2.

This relies on the following continuity theorem due to Reshetnyak [14], compare Thm. 1 in Sec. 1.3.4 of [9, Vol. II]. Here, for any $\mathbb{R}^{m}$-valued Radon measure $\mu$ defined on an open set $U \subset \mathbb{R}^{n+N}$, we will denote by $\vec{\mu}$ its Radon Nikodym derivative with respect to the total variation $|\mu|$, and by $\mu_{k} \rightharpoonup \mu$ the weak convergence in the sense of the measures.

Theorem 5.9 (Reshetnyak). Let $G(z, p)$ be a non-negative continuous function defined in $U \times \mathbb{R}^{m}$ satisfying the following properties:
i) $G(z, \cdot)$ is positively homogeneous of degree one for every $z$;
ii) $G(\cdot, p)$ is uniformly bounded as $p \in \mathbb{S}^{m-1}$;
iii) $G(z, \cdot)$ is essentially convex for every $z$, i.e.,

$$
G(z, p+q) \leq G(z, p)+G(z, q) \quad \forall p, q \in \mathbb{R}^{m}
$$

where the equality holds if and only if $q=\lambda p$ for some $\lambda \geq 0$.
Let $F(z, p)$ be a non-negative continuous function that is homogeneous of degree one in $p$ for every $z$ and that satisfies

$$
0 \leq F(z, p) \leq c_{1} G(z, p)+c_{2} \quad \forall(z, p) \in U \times \mathbb{R}^{m}
$$

for some absolute constants $c_{i}>0$. Then we have

$$
\lim _{k \rightarrow \infty} \int_{U} F\left(z, \vec{\mu}_{k}(z)\right) d\left|\mu_{k}\right|=\int_{U} F(z, \vec{\mu}(z)) d|\mu|
$$

provided that $\mu_{k}, \mu$ are $\mathbb{R}^{m}$-valued Radon measures on $U$ satisfying

$$
\mu_{k} \rightharpoonup \mu, \quad \int_{U} G\left(z, \vec{\mu}_{k}(z)\right) d\left|\mu_{k}\right| \rightarrow \int_{U} G(z, \vec{\mu}(z)) d|\mu| \quad \text { as } k \rightarrow \infty
$$

Proof of Proposition 5.8: We set $U=B^{n} \times \mathbb{R}^{N}, z=(x, u)$, and $m=1+n N$. As before, we identify vertical homology equivalence classes of currents $T \in \mathcal{D}_{n, 1}\left(B^{n} \times \mathcal{Y}\right)$, see (1.6), with measures $\mu_{(T)}$, and take the $\mathcal{E}_{1,1}$-norm of $T$ instead of the total variation of $\mu_{(T)}$, so that $\vec{\mu}_{(T)}=\vec{T}$ if $\|T\|_{\mathcal{E}_{1,1}}<\infty$ and $T=\|T\|_{\mathcal{E}_{1,1}}\llcorner\vec{T}$. Set now

$$
G(z, p):=F_{T V}(x, u, p), \quad F(z, p):=F_{f}(x, u, p)
$$

if $u \in \mathcal{Y}$ and $p$ is identified with the components $\xi_{(0)}+\xi_{(1)}$ of an $n$-vector satisfying $\xi \in \Lambda_{n}\left(\mathbb{R}^{n} \times T_{u} \mathcal{Y}\right)$ and $\xi^{\overline{0} 0} \geq 0$. By suitably extending $G$ and $F$, it is readily checked that we may and do apply Theorem 5.9. Since the convergence $\mu_{\left(T_{k}\right)} \rightharpoonup \mu_{(T)}$ reduces to the weak convergence $T_{k} \rightharpoonup T$ in $\mathcal{Z}_{n, 1}$, whereas

$$
\int_{U} G\left(z, \vec{\mu}_{(T)}(z)\right) d\left|\mu_{(T)}\right|=\mathcal{F}_{1,1}(T), \quad \int_{U} F\left(z, \vec{\mu}_{(T)}(z)\right) d\left|\mu_{(T)}\right|=\mathcal{F}_{f}(T)
$$

the proof is complete.
Proof of Theorem 5.6: We recall from [12] the main steps of the proof of Theorem 5.6 for the model case $f(x, u, G)=|G|$. In this case we have $\mathcal{L}_{f}(x)=\mathcal{L}_{T}(x)$ for $x \in J_{c}(T)$, see (3.7).

For every $m \in \mathbb{N}$ we find a closed subset $J_{m} \subset J_{c}(T)$ such that

$$
\begin{equation*}
J_{m} \subset J_{m+1} \quad \text { and } \quad \int_{J_{c}(T) \backslash J_{m}} \mathcal{L}_{T}(x) d \mathcal{H}^{n-1}(x)<\frac{1}{m} \quad \forall m . \tag{5.2}
\end{equation*}
$$

We also find an open subset $\Omega_{m} \subset B^{n} \backslash J_{m}$ and a $B V$-function $u_{m} \in B V\left(B^{n}, \mathcal{Y}\right)$ such that the following facts hold:
i) $u_{m}=u_{T}$ on $B^{n} \backslash \Omega_{m}$;
ii) $D u_{m}$ has no Cantor part, $\left|D^{C} u_{m}\right|\left(B^{n}\right)=0$;
iii) $u_{m} \rightharpoonup u_{T}$ weakly in the $B V$-sense with $\left|D u_{m}\right|\left(B^{n}\right) \rightarrow\left|D u_{T}\right|\left(B^{n}\right)$ as $m \rightarrow \infty$;
iv) $D^{a} u_{m} \rightharpoonup D^{a} u_{T}+D^{C} u_{T}$ and $\left|D^{a} u_{m}\right|\left(B^{n}\right) \rightarrow\left|D^{a} u_{T}\right|\left(B^{n}\right)+\left|D^{C} u_{T}\right|\left(B^{n}\right)$;
v) setting

$$
T_{m}:=G_{u_{m}}\left\llcorner\Omega_{m} \times \mathcal{Y}+T\left\llcorner\left(B^{n} \backslash \Omega_{m}\right) \times \mathcal{Y},\right.\right.
$$

then $T_{m} \in \operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$ and $T_{m} \rightharpoonup T$ weakly in $\mathcal{Z}_{n, 1}\left(B^{n} \times \mathcal{Y}\right)$;
vi) $\mathcal{E}_{1,1}\left(T_{m}, \Omega_{m} \times \mathcal{Y}\right) \rightarrow\left|D^{a} u_{T}\right|\left(B^{n}\right)+\left|D^{C} u_{T}\right|\left(B^{n}\right)$ by iv), so that by (5.2) we obtain

$$
\lim _{m \rightarrow \infty} \mathcal{E}_{1,1}\left(T_{m}, B^{n} \times \mathcal{Y}\right)=\mathcal{E}_{1,1}\left(T, B^{n} \times \mathcal{Y}\right) .
$$

From the above properties we also infer that

$$
\lim _{m \rightarrow \infty} \mathcal{F}_{1,1}\left(T_{m}, B^{n} \times \mathcal{Y}\right)=\mathcal{F}_{1,1}\left(T, B^{n} \times \mathcal{Y}\right) .
$$

Therefore, by Proposition 5.8 we obtain

$$
\lim _{m \rightarrow \infty} \mathcal{F}_{f}\left(T_{m}, B^{n} \times \mathcal{Y}\right)=\mathcal{F}_{f}\left(T, B^{n} \times \mathcal{Y}\right),
$$

where $\mathcal{F}_{f}$ is the parametric variational integral associated to the integrand $f$, see (2.6). Now, the first two terms in $\mathcal{E}_{f}(T)$, corresponding to the "diffuse" part $\nabla u_{T} d x+D^{C} u_{T}$ of $D u_{T}$, agree with the corresponding terms of $\mathcal{F}_{f}(T)$, see Remark 3.4. Moreover, since $\Omega_{m} \subset B^{n} \backslash J_{m}$, property (4.1) yields that

$$
\int_{J_{c}(T) \cap \Omega_{m}} f_{T}(x) d \mathcal{H}^{n-1}(x) \leq \int_{J_{c}(T) \backslash J_{m}} f_{T}(x) d \mathcal{H}^{n-1}(x) \leq C_{2} \int_{J_{c}(T) \backslash J_{m}} \mathcal{L}_{T}(x) d \mathcal{H}^{n-1}(x) .
$$

By (5.2) we readily conclude that $\mathcal{E}_{f}\left(T_{m}\right) \rightarrow \mathcal{E}_{f}(T)$, as required.
Proof of Theorem 5.7: For any $\widetilde{T} \in \operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$ we set

$$
\begin{equation*}
\mu_{J c, \widetilde{T}}(B):=\int_{J_{c}(\widetilde{T}) \cap B} f_{\widetilde{T}}(x) d \mathcal{H}^{n-1}(x) . \tag{5.3}
\end{equation*}
$$

We also denote by $\mathbf{F}(\widetilde{T})$ the flat norm

$$
\mathbf{F}(\widetilde{T}):=\sup \left\{\widetilde{T}(\phi) \mid \phi \in \mathcal{Z}^{n-1}\left(B^{n} \times \mathcal{Y}\right), \mathbf{F}(\phi) \leq 1\right\}
$$

where

$$
\mathbf{F}(\phi):=\max \left\{\sup _{z \in B^{n} \times \mathcal{Y}}\|\phi(z)\|, \sup _{z \in B^{n} \times \mathcal{Y}}\|d \phi(z)\|\right\}
$$

and recall that the flat convergence $\mathbf{F}\left(T_{k}-T\right) \rightarrow 0$ yields the weak convergence $T_{k} \rightharpoonup T$ in $\mathcal{Z}_{n, 1}\left(B^{n} \times \mathcal{Y}\right)$, compare [15]. Arguing as in [12], we reduce to prove:

Proposition 5.10 Let $T \in \operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$ be such that the Cantor part $\left|D^{C} u_{T}\right|\left(B^{n}\right)=0$. Let $\varepsilon \in(0,1 / 2)$ and $k \in \mathbb{N}$. We can find a current $\widehat{T} \in \operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$ such that

$$
\begin{gather*}
\mathcal{E}_{f}\left(\widehat{T}, B^{n} \times \mathcal{Y}\right) \leq \mathcal{E}_{f}\left(T, B^{n} \times \mathcal{Y}\right)+\varepsilon^{k}, \quad\left|D^{C} u_{\widehat{T}}\right|\left(B^{n}\right)=0 \\
\mu_{J c, \widehat{T}}\left(B^{n}\right) \leq \frac{1}{2} \cdot \mu_{J c, T}\left(B^{n}\right) \quad \text { and } \quad \mathbf{F}(\widehat{T}-T) \leq \varepsilon^{k} \tag{5.4}
\end{gather*}
$$

where $\mu_{J c, T}$ is given by (5.3) and $\mathbf{F}$ is the flat norm.
In fact, by a diagonal argument, we find a sequence $\left\{T_{k}\right\} \subset \operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$ that weakly converges to $T$ with $\mathcal{E}_{f}\left(T_{k}\right) \rightarrow \mathcal{E}_{f}(T)$ as $k \rightarrow \infty$ and such that, if $u_{k}:=u_{T_{k}}$ is the $B V$-function corresponding to $T_{k}$, we have $\left|D^{C} u_{k}\right|\left(B^{n}\right)=0$ and $\mu_{J c, T_{k}}\left(B^{n}\right)=0$, so that $u_{k} \in W^{1,1}\left(B^{n}, \mathcal{Y}\right)$ for every $k$. Therefore, $T_{k}$ agrees with the current $G_{u_{k}}$ given by the integration of forms in $\mathcal{Z}^{n, 1}\left(B^{n} \times \mathcal{Y}\right)$ over the rectifiable graph of $u_{k}$, see (1.3), so that $\mathcal{E}_{f}\left(T_{k}\right)=\mathcal{E}_{f}\left(u_{k}\right)$.

By means of Bethuel's density theorem [4], for every $k$ we find a smooth sequence $\left\{u_{h}^{(k)}\right\}_{h} \subset C^{1}\left(B^{n}, \mathcal{Y}\right)$ that strongly converges to $u_{k}$ in the $W^{1,1}$-sense as $h \rightarrow \infty$. In fact, even if the first homotopy group $\pi_{1}(\mathcal{Y})$ is non-trivial, being commutative it is homeomorphic to the first homology group $H_{1}(\mathcal{Y})$. Therefore, the null-boundary condition (3.11) for $u_{k}$ allows to remove the ( $n-2$ )-dimensional singularities, compare [5] and e.g. [10]. Lower dimensional singularities are removed as in [4]. Now, by the dominated convergence theorem and by property (b), we infer that the strong convergence yields $G_{u_{h}^{(k)}} \rightharpoonup G_{u_{k}}$ with $\mathcal{E}_{f}\left(u_{h}^{(k)}\right) \rightarrow \mathcal{E}_{f}\left(u_{k}\right)$. The assertion then follows by means of a diagonal argument.

Remark 5.11 This is the exact point where the commutativity hypothesis on the first homotopy group $\pi_{1}(\mathcal{Y})$ is used, in addition to (3.11), see the counterexample in Section 6 below.

Proof of Proposition 5.10: We follow the lines of the proof of the corresponding proposition from [12] for the model case $f(x, u, G)=|G|$, but this time replacing the $B V$-energy $\mathcal{E}_{1,1}(T)$ with the energy $\mathcal{E}_{f}(T)$, taking $\mathcal{L}_{f}(x)$ instead of $\mathcal{L}_{T}(x)$, see (3.5), and setting $\mu_{T}:=\mu_{d, T}+\mu_{J c, T}$, where

$$
\mu_{d, T}(B):=\int_{B} f\left(x, u_{T}, \nabla u_{T}(x)\right) d x
$$

and $\mu_{J c, T}$ is given by (5.3), so that by (3.8) for every Borel set $B \subset B^{n}$ we have

$$
\mathcal{E}_{f}(T, B \times \mathcal{Y})=\mu_{T}(B)=\mu_{d, T}(B)+\mu_{J c, T}(B)
$$

as $\left|D^{C} u_{T}\right|\left(B^{n}\right)=0$. The proof from [12] continues to hold, taking into account the following modifications:

Step 1: Blow-up argument. We use the estimate $C_{\tilde{\sim}}\left|D u_{T}\right|(B) \leq \mu_{T}(B)$ to obtain the analogous conclusions. In addition, due to the continuity hypothesis on $\widetilde{f}$, property (c) in Sec. 3, and to the compactness of $\mathcal{Y}$ in $\mathbb{R}^{N}$, we may and do define the family of balls $B_{j}:=\bar{B}\left(p_{j}, r_{j}\right)$ with radii $r_{j}$ sufficiently small that for every $x \in B_{j}$ we have

$$
\begin{equation*}
\left|f(x, u, G)-f\left(p_{j}, u, G\right)\right| \leq \sigma(1+|G|) \quad \forall u \in \mathcal{Y}, \forall G \in M(N, n) \tag{5.5}
\end{equation*}
$$

We also remark that, since $f_{T}\left(p_{j}\right)$ is the $(n-1)$-dimensional density of $\mu_{J c, T}$ at $p_{j}$, we have

$$
\begin{equation*}
\left|\mu_{J c, T}\left(B_{j}\right)-f_{T}\left(p_{j}\right) \cdot \omega_{n-1} r_{j}^{n-1}\right| \leq \sigma \cdot \omega_{n-1} r_{j}^{n-1} \tag{5.6}
\end{equation*}
$$

Step 2: Approximation on the balls $B_{j}$. We have:
i) Since for every $v \in B V\left(B^{n}, \mathcal{Y}\right)$

$$
C_{1} \int_{B}|\nabla v| d x \leq \int_{B} f(x, v, \nabla v) d x \leq C_{2} \int_{B}(1+|\nabla v|) d x
$$

we conclude again that

$$
\int_{\Omega_{\delta} \backslash \widetilde{\Omega}_{\delta}} f\left(x, w_{j}^{\sigma}, \nabla w_{j}^{\sigma}\right) d x
$$

is small if $\delta$ and $\sigma$ are small.
ii) The current $\widehat{T}_{j}^{\sigma} \in \operatorname{cart}^{1,1}\left(\left(B_{R}^{n} \backslash \widetilde{\Omega}_{\delta}\right) \times \mathcal{Y}\right)$ satisfies the boundary condition

$$
\begin{aligned}
\partial \widehat{T}_{j}^{\sigma} & =\partial T_{\underset{\widetilde{ }}{\sigma}\left\llcorner\partial B_{R}^{n} \times \mathcal{Y}-\llbracket \partial D_{r} \times\{0\} \rrbracket \times \Gamma_{j}\right.} \\
& +\llbracket \partial \widetilde{\Omega}_{\delta} \cap B_{r}^{+} \rrbracket \times \delta_{z_{j}^{+}}-\llbracket \partial \widetilde{\Omega}_{\delta} \cap B_{r}^{-} \rrbracket \times \delta_{z_{j}^{-}}
\end{aligned}
$$

for a suitable integral chain $\Gamma_{j} \in \mathcal{D}_{1}(\mathcal{Y})$ satisfying

$$
\widehat{\pi}_{\#}\left(T\left\llcorner\left\{p_{j}\right\} \times \mathcal{Y}\right)=\Gamma_{j} \quad \text { on } \mathcal{Z}^{n, 1}\left(B^{n} \times \mathcal{Y}\right)\right.
$$

where $z_{j}^{ \pm}$are the one-sided approximate limits of $u_{T}$ at $p_{j}$, so that $\partial \Gamma_{j}=\delta_{z_{j}^{+}}-\delta_{z_{j}^{-}}$. Moreover, the following energy estimate holds:

$$
\begin{align*}
\mathcal{E}_{f}\left(\widehat{T}_{j}^{\sigma},\left(B_{R}^{n} \backslash \widetilde{\Omega}_{\delta}\right) \times \mathcal{Y}\right) & \leq \int_{B_{R}^{n}} f\left(x, u_{j}^{\sigma}, \nabla u_{j}^{\sigma}\right) d x  \tag{5.7}\\
& +c \sigma r^{n-1}+c \sigma \mu_{J c, T_{j}^{\sigma}}\left(B_{r}^{n}\right)
\end{align*}
$$

iii) To extend $\widehat{T}_{j}^{\sigma}$ to a current in $\operatorname{cart}^{1,1}\left(\operatorname{int}\left(B_{j}\right) \times \mathcal{Y}\right)$, we take $\gamma_{j} \in \Gamma_{T}\left(p_{j}\right)$ satisfying (3.6). By the construction $\gamma_{j}$ belongs to $\Gamma_{T_{j}^{\sigma}}\left(p_{j}\right)$ and satisfies

$$
\begin{equation*}
\mathcal{L}_{f, p_{j}}\left(\gamma_{j}\right)=f_{T_{j}^{\sigma}}\left(p_{j}\right)=f_{T}\left(p_{j}\right) \tag{5.8}
\end{equation*}
$$

and $\gamma_{j \#} \llbracket(0,1) \rrbracket=\Gamma_{j}$. Defining again $v_{j}^{\sigma}: \widetilde{\Omega}_{\delta} \rightarrow \mathcal{Y}$ by

$$
v_{j}^{\sigma}(x):=\gamma_{j}\left(\frac{1}{2}+\frac{x_{n}}{\varphi_{\delta}(y(\widetilde{x}))}\right), \quad \widetilde{x} \in D_{r}, \quad \rho \leq \varphi_{\delta}(y(\widetilde{x})) / 2
$$

and changing variable $t:=\frac{1}{2}+\frac{x_{n}}{\varphi_{\delta}(y(\widetilde{x}))}$ for every $\widetilde{x}$, we observe that by Fubini theorem

$$
\begin{aligned}
& \int_{\widetilde{\Omega}_{\delta}} f\left(p_{j}, v_{j}^{\sigma}(x), D v_{j}^{\sigma}(x)\right) d x= \\
& =\int_{D_{r}} d \mathcal{L}^{n-1}(\widetilde{x}) \int_{-\varphi_{\delta}(y(\widetilde{x})) / 2}^{\varphi_{\delta}(y(\widetilde{x})) / 2} \widetilde{f}\left(p_{j}, \gamma_{j}(t),\left(\varphi_{\delta}(y(\widetilde{x}))^{-1}\left(\left|\dot{\gamma}^{1}(t)\right|, \ldots,\left|\dot{\gamma}^{N}(t)\right|\right)\right)\right) d x_{n} \\
& =\int_{D_{r}} d \mathcal{L}^{n-1}(\widetilde{x}) \int_{0}^{1} \widetilde{f}\left(p_{j}, \gamma_{j}(t),\left(\varphi_{\delta}(y(\widetilde{x}))^{-1}\left(\left|\dot{\gamma}^{1}(t)\right|, \ldots,\left|\dot{\gamma}^{N}(t)\right|\right)\right)\right) \varphi_{\delta}(y(\widetilde{x})) d t
\end{aligned}
$$

the last term converging as $\delta \rightarrow 0^{+}$to

$$
\int_{D_{r}} d \mathcal{L}^{n-1}(\widetilde{x}) \int_{0}^{1} \widetilde{f}^{\infty}\left(p_{j}, \gamma_{j}(t),\left(\left|\dot{\gamma}_{j}^{1}(t)\right|, \ldots,\left|\dot{\gamma}_{j}^{N}(t)\right|\right)\right) d t=\mathcal{L}^{n-1}\left(D_{r}\right) \cdot \mathcal{L}_{f, p_{j}}\left(\gamma_{j}\right)
$$

by definition of recession function, and hence, definitely, to $\mathcal{L}^{n-1}\left(D_{r}\right) \cdot f_{T_{j}^{\sigma}}\left(p_{j}\right)$. On the other hand, by (5.5), (5.6), (4.1), and (5.8) we obtain

$$
\begin{aligned}
& \left|\int_{\widetilde{\Omega}_{\delta}} f\left(x, v_{j}^{\sigma}(x), D v_{j}^{\sigma}(x)\right) d x-\int_{\widetilde{\Omega}_{\delta}} f\left(p_{j}, v_{j}^{\sigma}(x), D v_{j}^{\sigma}(x)\right) d x\right| \leq \\
& \quad \leq \sigma \cdot \int_{\widetilde{\Omega}_{\delta}}\left(1+\left|D v_{j}^{\sigma}(x)\right|\right) d x \leq \sigma\left(\left|\widetilde{\Omega}_{\delta}\right|+\mathcal{L}^{n-1}\left(D_{r}\right) \cdot \int_{0}^{1}\left|\dot{\gamma}_{j}(t)\right| d t\right) \\
& \quad \leq \sigma\left(\left|\widetilde{\Omega}_{\delta}\right|+\mathcal{L}^{n-1}\left(D_{r}\right) C_{2} f_{T}\left(p_{j}\right)\right) \leq \sigma\left(\left|\widetilde{\Omega}_{\delta}\right|+c \cdot r^{n-1}\left(\mu_{J c, T}\left(B_{j}\right)+1\right)\right)
\end{aligned}
$$

where $c>0$ is an absolute constant.
iv) As a consequence, the function $v_{j}^{\sigma}$ satisfies the energy estimate

$$
\int_{\widetilde{\Omega}_{\delta}} f\left(x, v_{j}^{\sigma}, D v_{j}^{\sigma}\right) d x \leq c \sigma r^{n-1}+c \sigma \mu_{J c, T_{j}^{\sigma}}\left(B_{j}\right)+\mathcal{L}^{n-1}\left(D_{r}\right) \cdot f_{T_{j}^{\sigma}}\left(p_{j}\right)
$$

if $\delta>0$ is small. Therefore, on account of (5.7), the current $\widetilde{T}_{j}^{(\sigma)}:=\widehat{T}_{j}^{\sigma}+G_{v_{j}^{\sigma}}$ belongs to $\operatorname{cart}^{1,1}\left(\operatorname{int}\left(B_{j}\right) \times \mathcal{Y}\right)$ and satisfies

$$
\begin{aligned}
\mathcal{E}_{f}\left(\widetilde{T}_{j}^{(\sigma)}, \operatorname{int}\left(B_{j}\right) \times \mathcal{Y}\right) & \leq \mathcal{E}_{f}\left(T_{j}^{\sigma}, B_{R}^{n} \times \mathcal{Y}\right) \\
& +c \sigma r^{n-1}+c \sigma \mu_{J c, T_{j}^{\sigma}}\left(\bar{B}_{R}^{n}\right) .
\end{aligned}
$$

Step 3: Flat distance. Unchanged.
Step 4: Approximation on the whole domain. This time we obtain

$$
\mathcal{E}_{f}\left(T_{j}^{(\sigma)}, \operatorname{int}\left(B_{j}\right) \times \mathcal{Y}\right) \leq \int_{B_{j}} f\left(x, u_{T}, \nabla u_{T}\right) d x+(1+c \sigma) \mu_{J c, T}\left(B_{j}\right)+c \sigma r_{j}^{n-1}
$$

and hence

$$
\mathcal{E}_{f}\left(T^{\sigma}, B^{n} \times \mathcal{Y}\right) \leq \int_{B^{n}} f\left(x, u_{T}, \nabla u_{T}\right) d x+(1+c \sigma) \mu_{J_{c}, T}\left(B^{n}\right)+c \sigma \mathcal{H}^{n-1}(J)
$$

so that if $\sigma=\sigma\left(\varepsilon, k, J, \mu_{J c, T}\right)>0$ is small, we conclude with

$$
\mathcal{E}_{f}\left(T^{\sigma}, B^{n} \times \mathcal{Y}\right) \leq \mathcal{E}_{f}\left(T, B^{n} \times \mathcal{Y}\right)+\varepsilon^{k}
$$

as required.

## 6 The relaxed energy of functions

In this section we analyze the lower semicontinuous envelope (0.2) of the variational functional (0.1) corresponding to integrands $f$ defined as in Sec. 3. Of course, it may equivalently be defined for every function $u \in L^{1}\left(B^{n}, \mathcal{Y}\right)$ by

$$
\begin{array}{r}
\widetilde{\mathcal{E}_{f}}(u):=\inf \left\{\liminf _{k \rightarrow \infty} \int_{B^{n}} f\left(x, u_{k}, D u_{k}\right) d x \mid\left\{u_{k}\right\} \subset C^{1}\left(B^{n}, \mathcal{Y}\right)\right. \\
\left.u_{k} \rightarrow u \text { strongly in } L^{1}\left(B^{n}, \mathbb{R}^{N}\right)\right\} .
\end{array}
$$

For any $u \in B V\left(B^{n}, \mathcal{Y}\right)$ we denote by

$$
\begin{equation*}
\mathcal{T}_{u}^{1,1}:=\left\{T \in \operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right) \mid u_{T}=u\right\} \tag{6.1}
\end{equation*}
$$

the class of Cartesian currents $T$ in $\operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$ with underlying $B V$-function $u_{T}$ equal to $u$.
In the sequel we shall assume that the first homotopy group $\pi_{1}(\mathcal{Y})$ is commutative. We first prove
Proposition 6.1 Let $u \in L^{1}\left(B^{n}, \mathcal{Y}\right)$. The following facts are equivalent:
i) $u \in B V\left(B^{n}, \mathcal{Y}\right)$;
ii) the class $\mathcal{T}_{u}^{1,1}$ is non-empty;
iii) $\widetilde{\mathcal{E}_{f}}(u)<\infty$.

Proof: The implication i) $\Longrightarrow$ ii) was proved in [12]. To prove that ii) $\Longrightarrow$ iii) we observe that, if $T \in \mathcal{T}_{u}^{1,1}$, by Theorem 5.1 we find a sequence $\left\{u_{k}\right\} \subset C^{1}\left(B^{n}, \mathcal{Y}\right)$ such that $G_{u_{k}} \rightharpoonup T$ weakly in $\mathcal{Z}_{n, 1}\left(B^{n} \times \mathcal{Y}\right)$ and $\mathcal{E}_{f}\left(u_{k}\right) \rightarrow \mathcal{E}_{f}(T)$ as $k \rightarrow \infty$; this yields also that $u_{k} \rightharpoonup u_{T}$ weakly in the $B V$-sense, where $u_{T}=u$, and hence $\widetilde{\mathcal{E}_{f}}(u)<\infty$. To show that iii $) \Longrightarrow$ i), we observe that if $u_{k} \rightarrow u$ with $\int_{B^{n}} f\left(x, u_{k}, D u_{k}\right) d x \rightarrow \widetilde{\mathcal{E}_{f}}(u)<\infty$, by property (b) we have $\limsup _{k \rightarrow \infty} \int_{B^{n}}\left|D u_{k}\right| d x<\infty$ whence, possibly passing to a subsequence, $u_{k} \rightharpoonup u$ weakly in the $B V$-sense and finally $u \in B V\left(B^{n}, \mathcal{Y}\right)$.

From the results of the previous sections we also obtain the following representation formula.

Theorem 6.2 For every $u \in B V\left(B^{n}, \mathcal{Y}\right)$ we have

$$
\begin{equation*}
\widetilde{\mathcal{E}_{f}}(u)=\inf \left\{\mathcal{E}_{f}(T) \mid T \in \mathcal{T}_{u}^{1,1}\right\} \tag{6.2}
\end{equation*}
$$

Proof: Let $\left\{u_{k}\right\} \subset C^{1}\left(B^{n}, \mathcal{Y}\right)$ be a sequence of smooth maps with equibounded energies, $\sup _{k} \mathcal{E}_{f}\left(u_{k}\right)<\infty$, weakly converging to $u$ in the $B V$-sense, see Proposition 6.1. Since $\sup _{k}\left\|D u_{k}\right\|_{L^{1}}<\infty$, see property (b), by compactness, possibly passing to a subsequence we find that $G_{u_{k}} \rightharpoonup T$ weakly in $\mathcal{Z}_{n, 1}\left(B^{n} \times \mathcal{Y}\right)$ to some $T \in \operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$ satisfying $u_{T}=u$, i.e. $T \in \mathcal{T}_{u}^{1,1}$, see (6.1). Since by lower semicontinuity, Proposition 5.3,

$$
\mathcal{E}_{f}(T) \leq \liminf _{k \rightarrow \infty} \mathcal{E}_{f}\left(u_{k}\right)
$$

we readily conclude that

$$
\inf \left\{\mathcal{E}_{f}(T) \mid T \in \mathcal{T}_{u}^{1,1}\right\} \leq \widetilde{\mathcal{E}_{f}}(u)
$$

To prove the opposite inequality, by applying Theorem 5.1, for every $T \in \mathcal{T}_{u}^{1,1}$ we find a sequence $\left\{u_{k}\right\} \subset$ $C^{1}\left(B^{n}, \mathcal{Y}\right)$ such that $G_{u_{k}} \rightharpoonup T$ weakly in $\mathcal{Z}_{n, 1}\left(B^{n} \times \mathcal{Y}\right)$ and $\mathcal{E}_{f}\left(u_{k}\right) \rightarrow \mathcal{E}_{f}(T)$ as $k \rightarrow \infty$. Since the weak convergence $G_{u_{k}} \rightharpoonup T$ yields the convergence $u_{k} \rightarrow u_{T}$ weakly in the $B V$-sense, hence strongly in $L^{1}$, and $u_{T}=u$, we find that $\widetilde{\mathcal{E}_{f}}(u) \leq \mathcal{E}_{f}(T)$.

As a consequence, by the definition (3.8) of $f$-energy we readily obtain
Corollary 6.3 For every $u \in B V\left(B^{n}, \mathcal{Y}\right)$ we have

$$
\begin{align*}
\widetilde{\mathcal{E}_{f}}(u) & =\int_{B^{n}} f(x, u(x), \nabla u(x)) d x+\int_{B^{n}} f^{\infty}\left(x, u^{+}(x), \frac{d D^{C} u}{d\left|D^{C} u\right|}(x)\right) d\left|D^{C} u\right| \\
& +\inf \left\{\int_{J_{c}(T)} f_{T}(x) d \mathcal{H}^{n-1}(x) \mid T \in \mathcal{T}_{u}^{1,1}\right\} \tag{6.3}
\end{align*}
$$

THE CASE OF SIMPLY-CONNECTED MANIFOLDS. If the first homotopy group $\pi_{1}(\mathcal{Y})$ is trivial, e.g., if $\mathcal{Y}=\mathbb{S}^{p}$ for some $p \geq 2$, on account of Remark 3.6 we readily infer:

Corollary 6.4 Assume that $\pi_{1}(\mathcal{Y})=0$. Then for every $u \in B V\left(B^{n}, \mathcal{Y}\right)$ we have

$$
\begin{aligned}
\widetilde{\mathcal{E}_{f}}(u) & =\int_{B^{n}} f(x, u(x), \nabla u(x)) d x+\int_{B^{n}} f^{\infty}\left(x, u^{+}(x), \frac{d D^{C} u}{d\left|D^{C} u\right|}(x)\right) d\left|D^{C} u\right| \\
& +\int_{J_{u}} \Phi_{f, u}(x) d \mathcal{H}^{n-1}(x)
\end{aligned}
$$

where

$$
\Phi_{f, u}(x):=\inf \left\{\mathcal{L}_{f, x}(\gamma) \mid \gamma \in \Gamma_{u}(x)\right\}
$$

$\mathcal{L}_{f, x}(\gamma)$ is given by (3.4), and

$$
\Gamma_{u}(x):=\left\{\gamma \in \operatorname{Lip}([0,1], \mathcal{Y}) \mid \gamma(0)=u^{-}(x), \quad \gamma(1)=u^{+}(x)\right\}
$$

is the family of all smooth curves $\gamma$ in $\mathcal{Y}$ with end points $u^{ \pm}(x)$.
Remark 6.5 In the model cases $f(x, u, G)=|G|$, or $f(x, u, G)=\sqrt{1+|G|^{2}}$, we have $\mathcal{L}_{f, x}(\gamma)=\mathcal{L}(\gamma)$, the standard length of $\gamma$. Therefore, if $\pi_{1}(\mathcal{Y})=0$, we infer that $\Phi_{f, u}(x)$ agrees with the geodesic distance between $u^{-}(x)$ and $u^{+}(x)$.

Properties. Set now for every function $u \in L^{1}\left(B^{n}, \mathcal{Y}\right)$ and open set $A \subset B^{n}$, say $A \in \mathcal{A}\left(B^{n}\right)$,

$$
\begin{array}{r}
\overline{\mathcal{F}}(u, A):=\inf \left\{\liminf _{k \rightarrow \infty} \mathcal{E}_{f}\left(u_{k}, A\right) \mid\left\{u_{k}\right\} \subset C^{1}\left(B^{n}, \mathcal{Y}\right)\right. \\
\left.u_{k} \rightharpoonup u \text { strongly in } L^{1}\left(B^{n}, \mathbb{R}^{N}\right)\right\},
\end{array}
$$

where

$$
\mathcal{E}_{f}(v, A):=\int_{A} f(x, v, D v) d x, \quad v \in C^{1}\left(B^{n}, \mathcal{Y}\right), \quad A \in \mathcal{A}\left(B^{n}\right)
$$

From the above results we readily infer the following locality property:

Corollary 6.6 For every $u, v \in B V\left(B^{n}, \mathcal{Y}\right)$ such that $u=v$ a.e. on $B^{n}$ we have

$$
\overline{\mathcal{F}}(u, A)=\overline{\mathcal{F}}(v, A) \quad \forall A \in \mathcal{A}\left(B^{n}\right) .
$$

However, a part from the case $\pi_{1}(\mathcal{Y})=0$, see Corollary 6.4, from Theorem 6.2 we infer that in general, for a given $u \in B V\left(B^{n}, \mathcal{Y}\right)$, the set function $A \mapsto \overline{\mathcal{F}}(u, A)$ is not a measure.

A COUNTEREXAMPLE. If the first homotopy group $\pi_{1}(\mathcal{Y})$ is non-commutative, the density theorem 5.1 fails to hold, even in dimension $n=2$ and with $T=G_{u}$ for some Sobolev map $u \in W^{1,1}\left(B^{n}, \mathcal{Y}\right)$, see (1.3). For example, take as $\mathcal{Y}$ a 2-surface of genus two in $\mathbb{R}^{3}$, e.g.., the standard torus with two "holes", and let $\varphi: \mathbb{S}^{1} \rightarrow \mathcal{Y}$ be a Lipschitz function that is not homotopic to a constant map in $\mathcal{Y}$ but satisfies $\varphi_{\#} \llbracket \mathbb{S}^{1} \rrbracket=0$, hence $\varphi$ is homologically trivial. The map $\varphi$ can be obtained by describing a continuous loop that belongs to the nontrivial homotopy class given by the sequence of letters $A B A^{-1} B^{-1}$, where $A, B$ are suitable generators of $\pi_{1}(\mathcal{Y})$. Setting $u(x):=\varphi(x /|x|)$, since $\partial G_{u}=-\delta_{0} \times \varphi_{\#} \llbracket \mathbb{S}^{1} \rrbracket$, see [9, Vol. I, Sec. 3.2.2], the current $G_{u}$ satisfies (3.11) and hence belongs to $\operatorname{cart}^{1,1}\left(B^{n} \times \mathcal{Y}\right)$. Taking e.g. the area integrand $f(x, u, G)=\sqrt{1+|G|^{2}}$, we cannot find a sequence of smooth maps $u_{k}: B^{2} \rightarrow \mathcal{Y}$ such that $G_{u_{h}} \rightharpoonup G_{u}$ weakly in $\mathcal{Z}_{2,1}\left(B^{2} \times \mathcal{Y}\right)$ and $\mathcal{E}_{f}\left(u_{k}\right) \rightarrow \mathcal{E}_{f}(u)$. In fact, as noticed in [1], as a consequence of Theorem 5.9, one obtains that the conditions

$$
u_{k} \rightarrow u \quad \text { in } L^{1}, \quad D u_{k} \rightarrow D u \quad \text { weakly* in } L^{1}, \quad \int_{B^{2}} \sqrt{1+\left|D u_{k}\right|^{2}} d x \rightarrow \int_{B^{2}} \sqrt{1+|D u|^{2}} d x
$$

yield that $u_{k} \rightarrow u$ strongly in $W^{1,1}$. Therefore, by B. White's results [16], for a.e. radius $0<r<1$ the restriction $u_{\mid \partial B_{r}^{2}}$ of $u$ to the boundary of the 2-ball of radius $r$ should have the same homotopy type of $u_{k \mid \partial B_{r}^{2}}$, a contradiction, as $u_{\mid \partial B_{r}^{2}} \sim \varphi$ but $u_{k \mid \partial B_{r}^{2}} \sim 0$. On the other hand, since $G_{u} \in \mathcal{T}_{u}^{1,1}$ we clearly have

$$
\inf \left\{\mathcal{E}_{f}(T) \mid T \in \mathcal{T}_{u}^{1,1}\right\}=\mathcal{E}_{f}(u):=\int_{B^{2}} \sqrt{1+|D u|^{2}} d x
$$

but we have seen that $\widetilde{\mathcal{E}_{f}}(u)>\mathcal{E}_{f}(u)$, hence (6.2) fails to hold.
