Terrà un seminario dal titolo:

“Symplectic invariants of Hermitian symmetric spaces”

Abstract:

The Gromov width of a symplectic n -dimensional manifold M gives the sup of the $r > 0$ such that there exists a symplectic embedding of the open ball of radius r of the euclidean n -dimensional space (endowed with the standard symplectic form) into M . In this talk we compute the Gromov width of Hermitian symmetric spaces of compact and non-compact type. The theorems we present are contained in a paper joint with A.Loi and R.Mossa recently accepted for publication in the Journal of Symplectic Geometry, and generalize analogous results proved by Guangcun Lu for Grassmannians and their products.

Tutti gli interessati sono invitati a partecipare.
