

ADJOINT METHODS FOR OBSTACLE PROBLEMS AND WEAKLY COUPLED SYSTEMS OF PDE

FILIPPO CAGNETTI, DIOGO GOMES, HUNG VINH TRAN

ABSTRACT. The adjoint method, recently introduced by Evans, is used to study obstacle problems, weakly coupled systems, cell problems for weakly coupled systems of Hamilton–Jacobi equations, and weakly coupled systems of obstacle type. In particular, new results about the speed of convergence of some approximation procedures are derived.

Keywords: adjoint methods, cell problems, Hamilton–Jacobi equations, obstacle problems, weakly coupled systems, weak KAM theory.

2010 Mathematics Subject Classification: 35F20, 35F30, 37J50, 49L25.

1. INTRODUCTION

We study the speed of convergence of certain approximations for obstacle problems and weakly coupled systems of Hamilton–Jacobi equations, using the Adjoint Method. This technique, recently introduced by Evans (see [Eva10], and also [Tra11] and [CGT11]), is a very successful tool to understand several types of degenerate PDEs. It can be applied, for instance, to Hamilton–Jacobi equations with non convex Hamiltonians, e.g. time dependent (see [Eva10]) and time independent (see [Tra11]), to weak KAM theory (see [CGT11]), and to the infinity Laplacian equation (see [ES11]). We address here several new applications, and propose some new open questions. Further results, which will not be discussed here, can be found in [Eva10] and [CGT11].

1.1. Outline of the paper. The paper contains four further sections concerning obstacle problems, weakly coupled systems, effective Hamiltonian for weakly coupled systems of Hamilton–Jacobi equations, and weakly coupled systems of obstacle type, respectively. We use a common strategy to study all these problems. Note, however, that each of them presents different challenges, which are described in the corresponding sections. Also, we believe that the applications we present here illustrate how to face the difficulties that can be encountered in the study of other systems of PDEs and related models. In particular, we show how to control singular terms arising from the switching to an obstacle (Lemma 2.3), random switching (Lemma 3.2), or optimal switching (Lemma 5.5).

In order to clarify our approach, let us give the details of its application to the obstacle problem (see Section 2):

$$\begin{cases} \max\{u - \psi, u + H(x, Du)\} = 0 & \text{in } U, \\ u = 0 & \text{on } \partial U, \end{cases} \quad (1.1)$$

where $\psi : \overline{U} \rightarrow \mathbb{R}$ and $H : \mathbb{R}^n \times \overline{U} \rightarrow \mathbb{R}$ are smooth, with $\psi \geq 0$ on ∂U . Here and in all the paper, U is an open bounded domain in \mathbb{R}^n with smooth boundary, and $n \geq 2$. Moreover, we will denote with ν the *outer* unit normal to ∂U . This equation arises naturally in optimal control theory, in the study of optimal stopping (see [Lio82]). See also [BP88, IY90].

Classically, in order to study (1.1) one first modifies the equation, by adding a perturbation term that penalizes the region where $u > \psi$. Then, a solution is obtained as a limit of the solutions of the penalized problems. More precisely, let $\gamma : \mathbb{R} \rightarrow [0, +\infty)$ be smooth such that

$$\begin{cases} \gamma(s) = 0 \text{ for } s \leq 0, & \gamma(s) > 0 \text{ for } s > 0, \\ 0 < \gamma'(s) \leq 1 \text{ for } s > 0, & \text{and } \lim_{s \rightarrow +\infty} \gamma(s) = +\infty, \end{cases}$$

and define $\gamma^\varepsilon : \mathbb{R} \rightarrow [0, +\infty)$ as

$$\gamma^\varepsilon(s) := \gamma\left(\frac{s}{\varepsilon}\right), \text{ for all } s \in \mathbb{R}, \quad \text{for all } \varepsilon > 0. \quad (1.2)$$

In some of the problems we discuss we also require γ to be convex in order to obtain improved results, but that will be pointed out where necessary. For every $\varepsilon > 0$, one can introduce the penalized PDE

$$\begin{cases} u^\varepsilon + H(x, Du^\varepsilon) + \gamma^\varepsilon(u^\varepsilon - \psi) = \varepsilon \Delta u^\varepsilon & \text{in } U, \\ u^\varepsilon = 0 & \text{on } \partial U. \end{cases} \quad (1.3)$$

To avoid confusion, we stress the fact that here $\gamma^\varepsilon(u^\varepsilon - \psi)$ stands for the composition of the function γ^ε with $u^\varepsilon - \psi$. Unless otherwise stated, we will often simply write γ^ε and $(\gamma^\varepsilon)'$ to denote $\gamma^\varepsilon(u^\varepsilon - \psi)$ and $(\gamma^\varepsilon)'(u^\varepsilon - \psi)$, respectively.

Thanks to [Lio82], for every $\varepsilon > 0$ there exists a smooth solution u^ε to (1.3). It is also well known that, up to subsequences, u^ε converges uniformly to a viscosity solution u of (1.1) (see also Section 2 for further details).

We face here the problem requiring a coercivity assumption on H and a compatibility condition for equation (1.1) (see hypotheses (H2.1) and (H2.2), respectively), and show that the speed of convergence in the general case is $O(\varepsilon^{1/2})$. Notice that we do not require the Hamiltonian H to be convex in p .

Theorem 1.1. *Suppose conditions (H2.1) and (H2.2) in Section 2 hold. Then, there exists a positive constant C , independent of ε , such that*

$$\|u^\varepsilon - u\|_{L^\infty} \leq C\varepsilon^{1/2}.$$

The proof of Theorem 1.1 consists of three steps.

Step I: Preliminary Estimates. We first show that

$$\max_{x \in \bar{U}} \frac{u^\varepsilon(x) - \psi(x)}{\varepsilon} \leq C, \quad (1.4)$$

for some constant $C > 0$ independent of ε (see Lemma 2.2). This allows us to prove that

$$\|u^\varepsilon\|_{L^\infty}, \|Du^\varepsilon\|_{L^\infty} \leq C,$$

see Proposition 2.1.

Step II: Adjoint Method. We consider the formal linearization of (1.3), and then introduce the correspondent adjoint equation (see equation (2.6)). The study of this last equation for different values of the right-hand side allows us to obtain several useful estimates (see Lemma 2.3 and Lemma 2.4).

Step III: Conclusion. We conclude the proof of Theorem 1.1 by showing that

$$\max_{x \in \bar{U}} |u_\varepsilon^\varepsilon(x)| \leq \frac{C}{\varepsilon^{1/2}}, \quad u_\varepsilon^\varepsilon(x) := \frac{\partial u^\varepsilon}{\partial \varepsilon}(x), \quad (1.5)$$

for some constant $C > 0$ independent of ε (see Lemma 2.5). The most delicate part of the proof of (1.5) consists in controlling the term (see relation (2.11))

$$\gamma_\varepsilon^\varepsilon(s) := \frac{\partial \gamma^\varepsilon}{\partial \varepsilon}(s) = -\frac{s}{\varepsilon^2} \gamma' \left(\frac{s}{\varepsilon} \right), \quad \text{for } s \in \mathbb{R}. \quad (1.6)$$

We underline that getting a bound for (1.6) can be extremely hard in general. In this context, this is achieved by differentiating equation (1.3) w.r.t. ε (see equation (2.10)), and then by using inequality (1.4), Lemma 2.3 and Lemma 2.4. This means that we overcome the problem by essentially using the Maximum Principle and the monotonicity of γ^ε (see estimates (2.12) and (2.13)). We were not able to obtain such a bound when dealing with homogenization or singular perturbation, where also similar terms appear. We believe it would be very interesting to find the correct way to apply the Adjoint Method in these situations.

In Section 3 we study monotone weakly coupled systems of Hamilton–Jacobi equations

$$\begin{cases} c_{11}u_1 + c_{12}u_2 + H_1(x, Du_1) = 0, \\ c_{21}u_1 + c_{22}u_2 + H_2(x, Du_2) = 0, \end{cases} \quad \text{in } U, \quad (1.7)$$

with boundary conditions $u_1 = u_2 = 0$ on ∂U , by considering the following approximation:

$$\begin{cases} c_{11}u_1^\varepsilon + c_{12}u_2^\varepsilon + H_1(x, Du_1^\varepsilon) = \varepsilon \Delta u_1^\varepsilon \\ c_{21}u_1^\varepsilon + c_{22}u_2^\varepsilon + H_2(x, Du_2^\varepsilon) = \varepsilon \Delta u_2^\varepsilon \end{cases} \quad \text{in } U,$$

with $u_1^\varepsilon = u_2^\varepsilon = 0$ on ∂U . Under some coupling assumptions on the coefficients (see conditions (H3.2) and (H3.3)), Engler and Lenhart [EL91], Ishii and Koike [IK91] prove existence, uniqueness and stability for the viscosity solutions (u_1, u_2) of (1.7), but they do not consider any approximation of the system. We observe that these coupling assumptions are similar to monotone conditions of single equations, and play a crucial role in the establishment of the comparison principle and uniqueness result, and thus cannot be removed.

We show that, under the same assumptions of [EL91], the speed of convergence of $(u_1^\varepsilon, u_2^\varepsilon)$ to (u_1, u_2) is $O(\varepsilon^{1/2})$ (see Theorem 3.5). For the sake of simplicity, we just focus on a system of two equations, but the general case can be treated in a similar way.

Section 4 is devoted to an analog of the *cell problem* introduced by Lions, Papanicolaou and Varadhan [LPV88]. More precisely, we consider the following quasi-monotone weakly coupled system of Hamilton–Jacobi equations:

$$\begin{cases} c_1 u_1 - c_1 u_2 + H_1(x, Du_1) = \overline{H}_1 \\ -c_2 u_1 + c_2 u_2 + H_2(x, Du_1) = \overline{H}_2 \end{cases} \quad \text{in } \mathbb{T}^n, \quad (1.8)$$

also called the *cell problem*. Here c_1 and c_2 are positive constants and $H_1, H_2 : \mathbb{T}^n \times \mathbb{R}^n \rightarrow \mathbb{R}$ are smooth, while $u_1, u_2 : \mathbb{T}^n \rightarrow \mathbb{R}$ and $\overline{H}_1, \overline{H}_2 \in \mathbb{R}$ are unknowns. Systems of this type have been studied by Camilli, Loreti and Yamada in [CL08] and [CLY09], for uniformly convex Hamiltonians in a bounded domain. They arise naturally in optimal control and in large deviation theory for random evolution processes. Under a coercivity-like assumption on H_1, H_2 (see condition (H4.1)), we obtain the following new result.

Theorem 1.2. *Assume that (H4.1) holds. Then, there exists a pair of constants $(\overline{H}_1, \overline{H}_2)$ such that (1.8) admits a viscosity solution $(u_1, u_2) \in C(\mathbb{T}^n)^2$.*

One can easily see that the pair $(\overline{H}_1, \overline{H}_2)$ is not unique (see Remark 4.4). Nevertheless, we have the following.

Theorem 1.3. *There exists a unique $\mu \in \mathbb{R}$ such that*

$$c_2 \overline{H}_1 + c_1 \overline{H}_2 = \mu,$$

for every pair $(\overline{H}_1, \overline{H}_2) \in \mathbb{R}^2$ such that (1.8) admits a viscosity solution $(u_1, u_2) \in C(\mathbb{T}^n)^2$.

Theorem 1.3 can be rephrased by saying that there exists a unique $\overline{H} \in \mathbb{R}$ such that the system

$$\begin{cases} c_1 u_1 - c_1 u_2 + H_1(x, Du_1) = \overline{H} \\ -c_2 u_1 + c_2 u_2 + H_2(x, Du_2) = \overline{H} \end{cases} \quad \text{in } \mathbb{T}^n, \quad (1.9)$$

admits viscosity solutions $u_1, u_2 \in C(\mathbb{T}^n)$, with (see Remark 4.5)

$$\overline{H} = \frac{\mu}{c_1 + c_2}.$$

Thus, this is the analogous to the uniqueness result of the effective Hamiltonian for the single equation case in [LPV88]. Notice that this *cell problem* is the important basis for the study of homogenization and large time behavior of weakly coupled systems of Hamilton–Jacobi equations.

Besides, we also consider the regularized system

$$\begin{cases} (c_1 + \varepsilon)u_1^\varepsilon - c_1 u_2^\varepsilon + H_1(x, Du_1^\varepsilon) = \varepsilon^2 \Delta u_1^\varepsilon \\ (c_2 + \varepsilon)u_2^\varepsilon - c_2 u_1^\varepsilon + H_2(x, Du_2^\varepsilon) = \varepsilon^2 \Delta u_2^\varepsilon \end{cases} \quad \text{in } \mathbb{T}^n, \quad (1.10)$$

and prove that both $\varepsilon u_1^\varepsilon$ and $\varepsilon u_2^\varepsilon$ converge uniformly to $-\overline{H}$ with speed of convergence $O(\varepsilon)$ (see Theorem 4.6). We call \overline{H} the effective Hamiltonian of the *cell problem* for the weakly coupled system of Hamilton–Jacobi equations.

In Section 5, we conclude the paper with the study of weakly coupled systems of obstacle type, namely

$$\begin{cases} \max\{u_1 - u_2 - \psi_1, u_1 + H_1(x, Du_1)\} = 0 & \text{in } U, \\ \max\{u_2 - u_1 - \psi_2, u_2 + H_2(x, Du_2)\} = 0 & \text{in } U, \end{cases} \quad (1.11)$$

with boundary conditions $u_1 = u_2 = 0$ on ∂U . Problems of this type appeared in [CDE84] and [CLY09]. Here $H_1, H_2 : \overline{U} \times \mathbb{R}^n \rightarrow \mathbb{R}$ and $\psi_1, \psi_2 : \overline{U} \rightarrow \mathbb{R}$ are smooth, with $\psi_1, \psi_2 \geq \alpha > 0$.

In this case, although the two equations in (1.11) are coupled just through the difference $u_1 - u_2$ (*weakly* coupled system), the problem turns out to be considerably more difficult than the corresponding scalar equation (1.1). Indeed, we cannot show now the analogous of estimate (1.4) as in Section 2. For this reason, the hypotheses we require are stronger than in the scalar case. Together with the usual hypotheses of coercivity and compatibility (see conditions (H5.2) and (H5.4)), we have to assume that $H_1(x, \cdot)$ and $H_2(x, \cdot)$ are convex (see (H5.1)), and we also ask that $D_x H_1$ and $D_x H_2$ are bounded (see (H5.3)). Under these hypotheses, that are natural in optimal switching problems, we are able to establish several delicate estimates by crucially employing the adjoint method (Lemmas from 5.5 to 5.7), which then yield a rate of convergence (Theorem 5.1).

1.2. Acknowledgments. The authors are grateful to Craig Evans and Fraydoun Rezakhanlou for very useful discussions on the subject of the paper. We thank the anonymous referee for many valuable comments and suggestions. Filippo Cagnetti was partially supported by FCT through the CMU|Portugal program. Hung Tran was partially supported by VEF fellowship.

2. OBSTACLE PROBLEM

In this section, we study the following obstacle problem

$$\begin{cases} \max\{u - \psi, u + H(x, Du)\} = 0 & \text{in } U \\ u = 0 & \text{on } \partial U, \end{cases} \quad (2.1)$$

where $\psi : \bar{U} \rightarrow \mathbb{R}$ and $H : \bar{U} \times \mathbb{R}^n \rightarrow \mathbb{R}$ are smooth, with $\psi \geq 0$ on ∂U . We also assume that

(H2.1) there exists $\beta > 0$ such that

$$\lim_{|p| \rightarrow +\infty} (\beta |H(x, p)|^2 + D_x H(x, p) \cdot p) = \lim_{|p| \rightarrow +\infty} \frac{H(x, p)}{|p|} = +\infty \text{ uniformly in } x \in \bar{U};$$

(H2.2) there exists a function $\Phi \in C^2(U) \cap C^1(\bar{U})$ such that $\Phi \leq \psi$ on \bar{U} , $\Phi = 0$ on ∂U and

$$\Phi + H(x, D\Phi) < 0 \quad \text{in } \bar{U}.$$

We observe that in the classical case $H(x, p) = \mathcal{H}(p) + V(x)$ with

$$\lim_{|p| \rightarrow +\infty} \frac{\mathcal{H}(p)}{|p|} = +\infty,$$

or when H is superlinear in p and $|D_x H(x, p)| \leq C(1 + |p|)$, then we immediately have (H2.1). Assumption (H2.2) (stating, in particular, that Φ is a sub-solution of (2.1)), will be used to derive the existence of solutions of (2.1), and to give a uniform bound for the gradient of solutions of the penalized equation below.

2.1. The classical approach. For every $\varepsilon > 0$, the *penalized* equation of (2.1) is given by

$$\begin{cases} u^\varepsilon + H(x, Du^\varepsilon) + \gamma^\varepsilon(u^\varepsilon - \psi) = \varepsilon \Delta u^\varepsilon & \text{in } U, \\ u^\varepsilon = 0 & \text{on } \partial U, \end{cases} \quad (2.2)$$

where γ^ε is defined by (1.2). From [Lio82] it follows that under conditions (H2.1) and (H2.2), for every $\varepsilon > 0$ there exists a smooth solution u^ε to (2.2). The first result we establish is a uniform bound for the C^1 -norm of the sequence $\{u^\varepsilon\}$.

Proposition 2.1. *There exists a positive constant C , independent of ε , such that*

$$\|u^\varepsilon\|_{L^\infty}, \|Du^\varepsilon\|_{L^\infty} \leq C.$$

In order to prove Proposition 2.1, we need the following fundamental lemma:

Lemma 2.2. *There exists a constant $C > 0$, independent of ε , such that*

$$\max_{x \in \bar{U}} \gamma^\varepsilon(u^\varepsilon - \psi) \leq C, \quad \max_{x \in \bar{U}} \frac{u^\varepsilon - \psi}{\varepsilon} \leq C.$$

Proof. We only need to show that $\max_{x \in \bar{U}} \gamma^\varepsilon(u^\varepsilon - \psi) \leq C$, since then the second estimate follows directly by the definition of γ^ε . Since $u^\varepsilon - \psi \leq 0$ on ∂U , we have $\max_{x \in \partial U} \gamma^\varepsilon(u^\varepsilon - \psi) = 0$.

Now, if $\max_{x \in \bar{U}} \gamma^\varepsilon(u^\varepsilon - \psi) = 0$, then we are done. Thus, let us assume that there exists $x_1 \in U$ such that $\max_{x \in \bar{U}} \gamma^\varepsilon(u^\varepsilon - \psi) = \gamma^\varepsilon(u^\varepsilon - \psi)(x_1) > 0$. Since γ^ε is increasing, we also have $\max_{x \in U} (u^\varepsilon - \psi) = u^\varepsilon(x_1) - \psi(x_1)$. Thus, using (2.2), by the Maximum principle

$$\begin{aligned} (u^\varepsilon(x_1) - \psi(x_1)) + \gamma^\varepsilon(u^\varepsilon(x_1) - \psi(x_1)) &= \varepsilon \Delta u^\varepsilon(x_1) - H(x_1, Du^\varepsilon(x_1)) - \psi(x_1) \\ &\leq \varepsilon \Delta \psi(x_1) - H(x_1, D\psi(x_1)) - \psi(x_1). \end{aligned}$$

Since $u^\varepsilon(x_1) - \psi(x_1) > 0$,

$$\gamma^\varepsilon(u^\varepsilon(x_1) - \psi(x_1)) \leq \max_{x \in \bar{U}} (|\Delta \psi| + |H(x, D\psi)| + |\psi(x)|) \leq C,$$

for any $\varepsilon < 1$, and this concludes the proof. \square

Proof of Proposition 2.1. Suppose there exists $x_0 \in U$ such that $u^\varepsilon(x_0) = \max_{x \in \bar{U}} u^\varepsilon(x)$. Then, since $\Delta u^\varepsilon(x_0) \leq 0$ and using the fact that $\gamma^\varepsilon \geq 0$

$$\begin{aligned} u^\varepsilon(x_0) &= \varepsilon \Delta u^\varepsilon(x_0) - H(x_0, 0) - \gamma^\varepsilon(u^\varepsilon(x_0) - \psi(x_0)) \\ &\leq -H(x_0, 0) \leq \max_{x \in \bar{U}} (-H(x, 0)) \leq C. \end{aligned}$$

Let now $x_1 \in U$ be such that $u^\varepsilon(x_1) = \min_{x \in \bar{U}} u^\varepsilon(x)$. Then, using Lemma 2.2,

$$\begin{aligned} u^\varepsilon(x_1) &= \varepsilon \Delta u^\varepsilon(x_1) - H(x_1, 0) - \gamma^\varepsilon(u^\varepsilon(x_1) - \psi(x_1)) \\ &\geq -H(x_1, 0) - \gamma^\varepsilon(u^\varepsilon(x_1) - \psi(x_1)) \\ &\geq \min_{x \in \bar{U}} (-H(x, 0) - \gamma^\varepsilon(u^\varepsilon(x) - \psi(x))) \geq -C. \end{aligned}$$

This shows that $\|u^\varepsilon\|_{L^\infty}$ is bounded.

To prove that $\|Du^\varepsilon\|_{L^\infty}$ is bounded independently of ε , we first need to prove that $\|Du^\varepsilon\|_{L^\infty(\partial U)}$ is bounded by constructing appropriate barriers.

Let Φ be as in (H2.2). For ε small enough, we have that

$$\Phi + H(x, D\Phi) + \gamma^\varepsilon(\Phi - \psi) < \varepsilon \Delta \Phi,$$

and $\Phi = 0$ on ∂U . Therefore, Φ is a sub-solution of (2.2). By the comparison principle, $u^\varepsilon \geq \Phi$ in U .

Let now $d(x) = \text{dist}(x, \partial U)$. It is well-known that for some $\delta > 0$ $d \in C^2(U_\delta)$ and $|Dd| = 1$ in U_δ , where $U_\delta := \{x \in U : d(x) < \delta\}$. For $\mu > 0$ large enough, the uniform bound on $\|u^\varepsilon\|_{L^\infty}$ yields $v := \mu d \geq u^\varepsilon$ on ∂U_δ . Assumption (H2.1) then implies

$$v + H(x, Dv) + \gamma^\varepsilon(v - \psi) - \varepsilon \Delta v \geq H(x, \mu Dd) - C\mu \geq 0,$$

for μ is sufficiently large. So the comparison principle gives us that $\Phi \leq u^\varepsilon \leq v$ in U_δ . Thus, since ν is the *outer* unit normal to ∂U , and $\Phi = u^\varepsilon = v = 0$ on ∂U , we have

$$\frac{\partial v}{\partial \nu}(x) \leq \frac{\partial u^\varepsilon}{\partial \nu}(x) \leq \frac{\partial \Phi}{\partial \nu}(x), \quad \text{for } x \in \partial U.$$

Hence, we obtain $\|Du^\varepsilon\|_{L^\infty(\partial U)} \leq C$.

Next, let us set $w^\varepsilon = \frac{|Du^\varepsilon|^2}{2}$. By a direct computation one can see that

$$2(1 + (\gamma^\varepsilon)')w^\varepsilon + D_p H \cdot Dw^\varepsilon + D_x H \cdot Du^\varepsilon - (\gamma^\varepsilon)' Du^\varepsilon \cdot D\psi = \varepsilon \Delta w^\varepsilon - \varepsilon |D^2 u^\varepsilon|^2. \quad (2.3)$$

If $\|Du^\varepsilon\|_{L^\infty} \leq \max(\|D\psi\|_{L^\infty}, \|Du^\varepsilon\|_{L^\infty(\partial U)})$ then we are done.

Otherwise, $\max(\|D\psi\|_{L^\infty}, \|Du^\varepsilon\|_{L^\infty(\partial U)}) < \|Du^\varepsilon\|_{L^\infty}$. We can choose $x_2 \in U$ such that $w^\varepsilon(x_2) = \max_{x \in \bar{U}} w^\varepsilon(x)$. Then, using (2.3)

$$\begin{aligned} \varepsilon |D^2 u^\varepsilon|^2(x_2) &= \varepsilon \Delta w^\varepsilon(x_2) - 2w^\varepsilon(x_2) - D_x H(x_2, Du^\varepsilon(x_2)) \cdot Du^\varepsilon(x_2) \\ &\quad + (\gamma^\varepsilon)'(Du^\varepsilon(x_2) \cdot D\psi(x_2) - |Du^\varepsilon|^2(x_2)) \\ &\leq -D_x H(x_2, Du^\varepsilon(x_2)) \cdot Du^\varepsilon(x_2). \end{aligned} \quad (2.4)$$

Moreover, for ε sufficiently small we have

$$\varepsilon |D^2 u^\varepsilon|^2(x_2) \geq 2\beta \varepsilon^2 |\Delta u^\varepsilon(x_2)|^2 = 2\beta [u^\varepsilon(x_2) + H(x_2, Du^\varepsilon(x_2)) + \gamma^\varepsilon(u^\varepsilon(x_2) - \psi(x_2))]^2.$$

By Young's inequality,

$$\begin{aligned} \varepsilon |D^2 u^\varepsilon|^2(x_2) &\geq \beta |H(x_2, Du^\varepsilon(x_2))|^2 - 2\beta [u^\varepsilon(x_2) + \gamma^\varepsilon(u^\varepsilon(x_2) - \psi(x_2))]^2 \\ &\geq \beta |H(x_2, Du^\varepsilon(x_2))|^2 - C_\beta, \end{aligned} \quad (2.5)$$

for some positive constant C_β , where we used Lemma 2.2 for the last inequality. Collecting (2.4) and (2.5)

$$\beta |H(x_2, Du^\varepsilon(x_2))|^2 + D_x H(x_2, Du^\varepsilon(x_2)) \cdot Du^\varepsilon(x_2) \leq C_\beta.$$

Recalling hypothesis (H2.1), we must have

$$\|Du^\varepsilon\|_{L^\infty} = |Du^\varepsilon(x_2)| \leq C.$$

□

Thanks to Proposition 2.1 one can show that, up to subsequences, u^ε converges uniformly to a viscosity solution u of the obstacle problem (2.1).

2.2. Proof of Theorem 1.1. We now study the speed of convergence.

To prove our theorem we need several steps.

Adjoint method: The formal linearized operator $L^\varepsilon : C^2(U) \rightarrow C(U)$ corresponding to (2.2) is given by

$$L^\varepsilon z := (1 + (\gamma^\varepsilon)')z + D_p H \cdot Dz - \varepsilon \Delta z.$$

We will now introduce the adjoint PDE corresponding to L^ε . Let $x_0 \in U$ be fixed. We denote by σ^ε the solution of:

$$\begin{cases} (1 + (\gamma^\varepsilon)')\sigma^\varepsilon - \operatorname{div}(D_p H \sigma^\varepsilon) = \varepsilon \Delta \sigma^\varepsilon + \delta_{x_0}, & \text{in } U, \\ \sigma^\varepsilon = 0, & \text{on } \partial U, \end{cases} \quad (2.6)$$

where δ_{x_0} stands for the Dirac measure concentrated in x_0 . In order to show existence and uniqueness of σ^ε , we have to pass to a further adjoint equation. Let $f \in C(U)$ be fixed. Then, we denote by v the solution to

$$\begin{cases} (1 + (\gamma^\varepsilon)')v + D_p H \cdot Dv = \varepsilon \Delta v + f, & \text{in } U, \\ v = 0, & \text{on } \partial U. \end{cases} \quad (2.7)$$

When $f \equiv 0$, by using the Maximum Principle one can show that $v \equiv 0$ is the unique solution to (2.7). Thus, by the Fredholm Alternative we infer that (2.6) admits a unique solution σ^ε . Moreover, one can also prove that $\sigma^\varepsilon \in C^\infty(U \setminus \{x_0\})$. Some additional properties of σ^ε are given by the following lemma.

Lemma 2.3 (Properties of σ^ε). *Let ν denote the outer unit normal to ∂U . Then,*

- (i) $\sigma^\varepsilon \geq 0$ on \overline{U} . In particular, $\frac{\partial \sigma^\varepsilon}{\partial \nu} \leq 0$ on ∂U .
- (ii) The following equality holds:

$$\int_U (1 + (\gamma^\varepsilon)') \sigma^\varepsilon dx = 1 + \varepsilon \int_{\partial U} \frac{\partial \sigma^\varepsilon}{\partial \nu} dS.$$

In particular,

$$\varepsilon \int_{\partial U} \left| \frac{\partial \sigma^\varepsilon}{\partial \nu} \right| dS \leq 1.$$

Proof. First of all, consider equation (2.7) and observe that

$$f \geq 0 \implies v \geq 0. \quad (2.8)$$

Indeed, assume $f \geq 0$ and let $\bar{x} \in \bar{U}$ be such that

$$v(\bar{x}) = \min_{x \in \bar{U}} v(x).$$

We can assume that $\bar{x} \in U$, since otherwise clearly $v \geq 0$. Then, for every $x \in U$

$$((1 + (\gamma^\varepsilon)')v(\bar{x}) = \varepsilon \Delta v(\bar{x}) + f(\bar{x}) \geq 0,$$

and (2.8) follows, since $1 + (\gamma^\varepsilon)' > 0$.

Now, multiply equation (2.6) by v and integrate by parts, obtaining

$$\int_U f \sigma^\varepsilon dx = v(x_0).$$

Taking into account (2.8), from last relation we infer that

$$\int_U f \sigma^\varepsilon dx \geq 0 \quad \text{for every } f \geq 0,$$

and this implies $\sigma^\varepsilon \geq 0$.

To prove (ii), we integrate (2.6) over U , to get

$$\begin{aligned} \int_U (1 + (\gamma^\varepsilon)') \sigma^\varepsilon dx &= \int_U \operatorname{div}(D_p H \sigma^\varepsilon) dx + \varepsilon \int_U \Delta \sigma^\varepsilon dx + 1 \\ &= \int_{\partial U} (D_p H \cdot \nu) \sigma^\varepsilon dS + \varepsilon \int_{\partial U} \frac{\partial \sigma^\varepsilon}{\partial \nu} dS + 1 = \varepsilon \int_{\partial U} \frac{\partial \sigma^\varepsilon}{\partial \nu} dS + 1, \end{aligned}$$

where we used the fact that $\sigma^\varepsilon = 0$ on ∂U . □

Using the adjoint equation, we have the following new estimate.

Lemma 2.4. *There exists $C > 0$, independent of $\varepsilon > 0$, such that*

$$\frac{1}{2} \int_U (1 + (\gamma^\varepsilon)') |Du^\varepsilon|^2 \sigma^\varepsilon dx + \varepsilon \int_U |D^2 u^\varepsilon|^2 \sigma^\varepsilon dx \leq C. \quad (2.9)$$

Proof. Multiplying (2.3) by σ^ε and integrating by parts, using equation (2.6) we get

$$\begin{aligned} &\frac{1}{2} \int_U (1 + (\gamma^\varepsilon)') |Du^\varepsilon|^2 \sigma^\varepsilon dx + \varepsilon \int_U |D^2 u^\varepsilon|^2 \sigma^\varepsilon dx \\ &= -w^\varepsilon(x_0) - \int_U [D_x H \cdot Du^\varepsilon - (\gamma^\varepsilon)' D\psi \cdot Du^\varepsilon] \sigma^\varepsilon dx - \varepsilon \int_{\partial U} w^\varepsilon \frac{\partial \sigma^\varepsilon}{\partial \nu} dS. \end{aligned}$$

Thanks to Lemma 2.3 and Proposition 2.1 (which, in particular, implies $\|D_x H(\cdot, Du^\varepsilon(\cdot))\|_{L^\infty(U)} \leq C$) the conclusion follows. □

Relation (2.9) shows that we have a good control of the Hessian $D^2 u^\varepsilon$ in the support of σ^ε .

We finally have the following result, which immediately implies Theorem 1.1.

Lemma 2.5. *There exists $C > 0$, independent of ε , such that*

$$\max_{x \in \bar{U}} |u_\varepsilon^\varepsilon(x)| \leq \frac{C}{\varepsilon^{1/2}}.$$

Proof. By standard elliptic estimates, the solution u^ε is smooth in the parameter ε for $\varepsilon > 0$ (see [Eva10, Tra11] for similar arguments). Differentiating (2.2) w.r.t. ε we get

$$(1 + (\gamma^\varepsilon)')u_\varepsilon^\varepsilon + D_p H \cdot Du_\varepsilon^\varepsilon + \gamma_\varepsilon^\varepsilon = \varepsilon \Delta u_\varepsilon^\varepsilon + \Delta u^\varepsilon, \quad \text{in } U. \quad (2.10)$$

In addition, we have $u_\varepsilon^\varepsilon(x) = 0$ for all $x \in \partial U$, since $u^\varepsilon(x) = 0$ on ∂U for every ε . So, we may assume that there exists $x_2 \in U$ such that $|u_\varepsilon^\varepsilon(x_2)| = \max_{x \in \bar{U}} |u_\varepsilon^\varepsilon(x)|$.

Consider the adjoint equation (2.6), and choose $x_0 = x_2$. Multiplying by σ^ε both sides of (2.10) and integrating by parts,

$$u_\varepsilon^\varepsilon(x_2) = - \int_U \gamma_\varepsilon^\varepsilon \sigma^\varepsilon dx + \int_U \Delta u^\varepsilon \sigma^\varepsilon dx.$$

Hence,

$$|u_\varepsilon^\varepsilon(x_2)| \leq \int_U |\gamma_\varepsilon^\varepsilon| \sigma^\varepsilon dx + \int_U |\Delta u^\varepsilon| \sigma^\varepsilon dx. \quad (2.11)$$

By Lemma 2.2,

$$|\gamma_\varepsilon^\varepsilon| = \left| -\frac{u^\varepsilon - \psi}{\varepsilon^2} \gamma' \left(\frac{u^\varepsilon - \psi}{\varepsilon} \right) \right| = \left| \frac{u^\varepsilon - \psi}{\varepsilon} (\gamma^\varepsilon)' (u^\varepsilon - \psi) \right| \leq C(\gamma^\varepsilon)'. \quad (2.12)$$

Hence, thanks to Lemma 2.3

$$\int_U |\gamma_\varepsilon^\varepsilon| \sigma^\varepsilon dx \leq C \int_U (\gamma^\varepsilon)' \sigma^\varepsilon dx \leq C, \quad (2.13)$$

while using (2.9)

$$\begin{aligned} \int_U |\Delta u^\varepsilon| \sigma^\varepsilon dx &\leq \left(\int_U |\Delta u^\varepsilon|^2 \sigma^\varepsilon dx \right)^{1/2} \left(\int_U \sigma^\varepsilon dx \right)^{1/2} \\ &\leq C \left(\int_U |D^2 u^\varepsilon|^2 \sigma^\varepsilon dx \right)^{1/2} \left(\int_U \sigma^\varepsilon dx \right)^{1/2} \leq \frac{C}{\varepsilon^{1/2}}. \end{aligned} \quad (2.14)$$

Thus, by (2.11), (2.13) and (2.14)

$$|u_\varepsilon^\varepsilon(x_2)| \leq \frac{C}{\varepsilon^{1/2}}, \quad \text{for } \varepsilon < 1. \quad (2.15)$$

□

3. WEAKLY COUPLED SYSTEMS OF HAMILTON–JACOBI EQUATIONS

We study now the model of monotone weakly coupled systems of Hamilton–Jacobi equations considered by Engler and Lenhart [EL91], and by Ishii and Koike [IK91]. For the sake of simplicity, we will just focus on the following system of two equations:

$$\begin{cases} c_{11}u_1 + c_{12}u_2 + H_1(x, Du_1) = 0 \\ c_{21}u_1 + c_{22}u_2 + H_2(x, Du_2) = 0 \end{cases} \quad \text{in } U, \quad (3.1)$$

with boundary conditions $u_1 = u_2 = 0$ on ∂U . The general case of more equations can be treated in a similar way.

We assume that the Hamiltonians $H_1, H_2 : \bar{U} \times \mathbb{R}^n \rightarrow \mathbb{R}$ are smooth satisfying the following hypotheses.

(H3.1) There exists $\beta_1, \beta_2 > 0$ such that for every $j = 1, 2$

$$\lim_{|p| \rightarrow +\infty} (\beta_j |H_j(x, p)|^2 + D_x H_j(x, p) \cdot p) = \lim_{|p| \rightarrow +\infty} \frac{H_j(x, p)}{|p|} = +\infty \text{ uniformly in } x \in \bar{U}.$$

Following [EL91] and [IK91], we suppose further that

(H3.2) $c_{12}, c_{21} \leq 0$;

(H3.3) there exists $\alpha > 0$ such that $c_{11} + c_{12}, c_{21} + c_{22} \geq \alpha > 0$.

We observe that, as a consequence, we also have $c_{11}, c_{22} > 0$. Finally, we require that

(H3.4) There exist $\Phi_1, \Phi_2 \in C^2(U) \cap C^1(\bar{U})$ with $\Phi_j = 0$ on ∂U ($j = 1, 2$), and such that

$$\begin{cases} c_{11}\Phi_1 + c_{12}\Phi_2 + H_1(x, D\Phi_1) < 0 & \text{in } U, \\ c_{22}\Phi_2 + c_{21}\Phi_1 + H_2(x, D\Phi_2) < 0 & \text{in } U. \end{cases}$$

Thanks to these conditions, the Maximum Principle can be applied and existence, comparison and uniqueness results hold true, as stated in [EL91].

We consider now the following regularized system (here $\varepsilon > 0$):

$$\begin{cases} c_{11}u_1^\varepsilon + c_{12}u_2^\varepsilon + H_1(x, Du_1^\varepsilon) = \varepsilon \Delta u_1^\varepsilon \\ c_{21}u_1^\varepsilon + c_{22}u_2^\varepsilon + H_2(x, Du_2^\varepsilon) = \varepsilon \Delta u_2^\varepsilon \end{cases} \quad \text{in } U, \quad (3.2)$$

with boundary conditions $u_1^\varepsilon = u_2^\varepsilon = 0$ on ∂U .

Conditions (H3.1), (H3.2), and (H3.3) yield existence and uniqueness of the pair of solutions $(u_1^\varepsilon, u_2^\varepsilon)$ in (3.2). Next lemma gives a uniform bound for the C^1 norm of the sequences $\{u_i^\varepsilon\}$, $i = 1, 2$. Its proof, which is very similar to that one of Proposition 2.1, is still presented for readers' convenience.

Lemma 3.1. *There exists a positive constant C , independent of ε , such that*

$$\|u_i^\varepsilon\|_{L^\infty}, \|Du_i^\varepsilon\|_{L^\infty} \leq C, \quad \text{for } i = 1, 2.$$

Proof. Step I: Bound on $\|u_j^\varepsilon\|_{L^\infty}$, $j = 1, 2$.

First of all observe that $u_1^\varepsilon = u_2^\varepsilon = 0$ on ∂U for every ε . Thus, it will be sufficient to show that u_1^ε and u_2^ε are bounded in the interior of U . Without loss of generality, we can assume that there exists $\bar{x} \in U$ such that

$$\max_{\substack{j=1,2 \\ x \in \bar{U}}} u_j^\varepsilon(x) = u_1^\varepsilon(\bar{x}).$$

We have

$$\alpha u_1^\varepsilon(\bar{x}) \leq c_{11}u_1^\varepsilon(\bar{x}) + c_{12}u_2^\varepsilon(\bar{x}) \leq -H_1(\bar{x}, 0) \leq \max_{x \in \bar{U}} (-H_1(x, 0)),$$

where we used (H3.3) and equation (3.2). Analogously, if $\hat{x} \in U$ is such that

$$\min_{\substack{j=1,2 \\ x \in \bar{U}}} u_j^\varepsilon(x) = u_1^\varepsilon(\hat{x}),$$

then

$$u_1^\varepsilon(\hat{x}) \geq \frac{c_{11}}{c_{11} + c_{12}} u_1^\varepsilon(\hat{x}) + \frac{c_{12}}{c_{11} + c_{12}} u_2^\varepsilon(\hat{x}) \geq -\frac{H_1(\hat{x}, 0)}{c_{11} + c_{12}} \geq \frac{1}{c_{11} + c_{12}} \min_{x \in \bar{U}} (-H_1(x, 0)).$$

Concerning the bounds on the gradients, we will argue as in the proof of Proposition 2.1.

Step II: Bound on $\|Du_j^\varepsilon\|_{L^\infty(\partial U)}$, $j = 1, 2$.

We now show that

$$\max_{\substack{j=1,2 \\ x \in \partial U}} |Du_j^\varepsilon(x)| \leq C,$$

for some constant C independent of ε . As it was done in Section 2, we are going to construct appropriate barriers. For ε small enough, assumption (H3.4) implies that

$$\begin{cases} c_{11}\Phi_1 + c_{12}\Phi_2 + H_1(x, D\Phi_1) < \varepsilon\Delta\Phi_1 & \text{in } U, \\ c_{22}\Phi_2 + c_{21}\Phi_1 + H_2(x, D\Phi_2) < \varepsilon\Delta\Phi_2 & \text{in } U, \end{cases}$$

and $\Phi_1 = \Phi_2 = 0$ on ∂U . Therefore, (Φ_1, Φ_2) is a sub-solution of (3.2). By the comparison principle, $u_j^\varepsilon \geq \Phi_j$ in U , $j = 1, 2$. Let $d(x)$, δ , and U_δ be as in the proof of Proposition 2.1. For $\mu > 0$ large enough, the uniform bounds on $\|u_1^\varepsilon\|_{L^\infty}$ and $\|u_2^\varepsilon\|_{L^\infty}$ yield $v := \mu d \geq u_j^\varepsilon$ on ∂U_δ , $j = 1, 2$, so that

$$\begin{cases} (c_{11} + c_{12})v + H_1(x, Dv) - \varepsilon\Delta v \geq H_1(x, \mu Dd) - \mu C & \text{in } U, \\ (c_{21} + c_{22})v + H_2(x, Dv) - \varepsilon\Delta v \geq H_2(x, \mu Dd) - \mu C & \text{in } U. \end{cases}$$

Now, we have $\Phi_j = u_j^\varepsilon = v = 0$ on ∂U . Also, thanks to assumption (H3.1), for $\mu > 0$ large enough

$$\begin{cases} (c_{11} + c_{12})v + H_1(x, Dv) - \varepsilon \Delta v \geq 0 & \text{in } U, \\ (c_{21} + c_{22})v + H_2(x, Dv) - \varepsilon \Delta v \geq 0 & \text{in } U, \end{cases}$$

that is, the pair (v, v) is a super-solution for the system (3.2). Thus, the comparison principle gives us that $\Phi_j \leq u_j^\varepsilon \leq v$ in U_δ , $j = 1, 2$. Then, from the fact that $\Phi_j = u_j^\varepsilon = v = 0$ on ∂U we get

$$\frac{\partial v}{\partial \nu}(x) \leq \frac{\partial u_j^\varepsilon}{\partial \nu}(x) \leq \frac{\partial \Phi_j}{\partial \nu}(x), \quad \text{for } x \in \partial U, \quad j = 1, 2.$$

Hence, we obtain $\|Du_j^\varepsilon\|_{L^\infty(\partial U)} \leq C$, $j = 1, 2$.

Step III: Conclusion.

Setting $w_j^\varepsilon = \frac{|Du_j^\varepsilon|^2}{2}$, $j = 1, 2$, by a direct computation we have that

$$\begin{cases} 2c_{11}w_1^\varepsilon + D_p H_1 \cdot Dw_1^\varepsilon + c_{12}Du_1^\varepsilon \cdot Du_2^\varepsilon + D_x H_1 \cdot Du_1^\varepsilon = \varepsilon \Delta w_1^\varepsilon - \varepsilon |D^2 u_1^\varepsilon|^2, \\ 2c_{22}w_2^\varepsilon + D_p H_2 \cdot Dw_2^\varepsilon + c_{21}Du_1^\varepsilon \cdot Du_2^\varepsilon + D_x H_2 \cdot Du_2^\varepsilon = \varepsilon \Delta w_2^\varepsilon - \varepsilon |D^2 u_2^\varepsilon|^2. \end{cases} \quad (3.3)$$

Assume now that there exists $\hat{x} \in U$ such that

$$\max_{\substack{j=1,2 \\ x \in \bar{U}}} w_j^\varepsilon(x) = w_1^\varepsilon(\hat{x}).$$

Then, we have

$$\begin{aligned} \varepsilon |D^2 u_1^\varepsilon|^2(\hat{x}) &= \varepsilon \Delta w_1^\varepsilon(\hat{x}) - 2c_{11}w_1^\varepsilon(\hat{x}) - c_{12}Du_1^\varepsilon(\hat{x}) \cdot Du_2^\varepsilon(\hat{x}) - D_x H_1 \cdot Du_1^\varepsilon(\hat{x}) \\ &\leq -2(c_{11} + c_{12})w_1^\varepsilon(\hat{x}) - D_x H_1 \cdot Du_1^\varepsilon(\hat{x}) \leq -D_x H_1 \cdot Du_1^\varepsilon(\hat{x}). \end{aligned}$$

Now, arguing as in the proof of Proposition 2.1, for ε sufficiently small

$$\begin{aligned} \varepsilon |D^2 u_1^\varepsilon(\hat{x})|^2 &\geq 2\beta_1 \varepsilon^2 |\Delta u_1^\varepsilon(\hat{x})|^2 = 2\beta_1 [c_{11}u_1^\varepsilon(\hat{x}) + c_{12}u_2^\varepsilon(\hat{x}) + H_1(\hat{x}, Du_1^\varepsilon(\hat{x}))]^2 \\ &\geq \beta_1 |H_1(\hat{x}, Du_1^\varepsilon(\hat{x}))|^2 - C. \end{aligned}$$

Collecting the last two relations we have

$$\beta_1 |H_1(\hat{x}, Du_1^\varepsilon(\hat{x}))|^2 + D_x H_1(\hat{x}, Du_1^\varepsilon(\hat{x})) \cdot Du_1^\varepsilon(\hat{x}) \leq C.$$

Recalling condition (H3.1) the conclusion follows. \square

Adjoint method. At this point, we introduce the adjoint of the linearization of system (3.2). Let us emphasize that the adjoint equations we introduce form a system of weakly coupled type, which is very natural in this setting, and create a systematic way to the study of weakly coupled systems. The linearized operator corresponding to (3.2) is

$$L^\varepsilon(z_1, z_2) := \begin{cases} D_p H_1(x, Du_1^\varepsilon) \cdot Dz_1 + c_{11}z_1 + c_{12}z_2 - \varepsilon \Delta z_1, \\ D_p H_2(x, Du_2^\varepsilon) \cdot Dz_2 + c_{22}z_2 + c_{21}z_1 - \varepsilon \Delta z_2. \end{cases}$$

Let us now identify the adjoint operator $(L^\varepsilon)^*$. For every $\nu^1, \nu^2 \in C_c^\infty(U)$ we have

$$\begin{aligned}
\langle (L^\varepsilon)^*(\nu^1, \nu^2), (z_1, z_2) \rangle &:= \langle (\nu^1, \nu^2), L^\varepsilon(z_1, z_2) \rangle \\
&= \langle \nu^1, [L^\varepsilon(z_1, z_2)]_1 \rangle + \langle \nu^2, [L^\varepsilon(z_1, z_2)]_2 \rangle \\
&= \int_U [D_p H_1(x, Du_1^\varepsilon) \cdot Dz_1 + c_{11}z_1 + c_{12}z_2 - \varepsilon \Delta z_1] \nu^1 dx \\
&\quad + \int_U [D_p H_2(x, Du_2^\varepsilon) \cdot Dz_2 + c_{22}z_2 + c_{21}z_1 - \varepsilon \Delta z_2] \nu^2 dx \\
&= \int_U [-\operatorname{div}(D_p H_1 \nu^1) + c_{11}\nu^1 + c_{21}\nu^2 - \varepsilon \Delta \nu^1] z_1 dx \\
&\quad + \int_U [-\operatorname{div}(D_p H_2 \nu^2) + c_{22}\nu^2 + c_{12}\nu^1 - \varepsilon \Delta \nu^2] z_2 dx.
\end{aligned}$$

Then, the adjoint equations are:

$$\begin{cases} -\operatorname{div}(D_p H_1 \sigma^{1,\varepsilon}) + c_{11}\sigma^{1,\varepsilon} + c_{21}\sigma^{2,\varepsilon} = \varepsilon \Delta \sigma^{1,\varepsilon} + (2-i)\delta_{x_0} & \text{in } U, \\ -\operatorname{div}(D_p H_2 \sigma^{2,\varepsilon}) + c_{22}\sigma^{2,\varepsilon} + c_{12}\sigma^{1,\varepsilon} = \varepsilon \Delta \sigma^{2,\varepsilon} + (i-1)\delta_{x_0} & \text{in } U, \end{cases} \quad (3.4)$$

with boundary conditions

$$\begin{cases} \sigma^{1,\varepsilon} = 0 & \text{on } \partial U, \\ \sigma^{2,\varepsilon} = 0 & \text{on } \partial U, \end{cases}$$

where $i \in \{1, 2\}$ and $x_0 \in U$ will be chosen later. Observe that, once x_0 is given, the choice $i = 1$ ($i = 2$) corresponds to an adjoint system of two equations where a Dirac delta measure concentrated at x_0 appears only on the right-hand side of the first (second) equation. Existence and uniqueness of $\sigma^{1,\varepsilon}$ and $\sigma^{2,\varepsilon}$ follow by Fredholm alternative, by arguing as in Section 2, and we have $\sigma^{1,\varepsilon}, \sigma^{2,\varepsilon} \in C^\infty(U \setminus \{x_0\})$. We study now further properties of $\sigma^{1,\varepsilon}$ and $\sigma^{2,\varepsilon}$.

Lemma 3.2 (Properties of $\sigma^{1,\varepsilon}, \sigma^{2,\varepsilon}$). *Let ν be the outer unit normal to ∂U . Then*

- (i) $\sigma^{j,\varepsilon} \geq 0$ on \bar{U} . In particular, $\frac{\partial \sigma^{j,\varepsilon}}{\partial \nu} \leq 0$ on ∂U ($j = 1, 2$).
- (ii) The following equality holds:

$$\sum_{j=1}^2 \left(\int_U (c_{j1} + c_{j2}) \sigma^{j,\varepsilon} dx - \varepsilon \int_{\partial U} \frac{\partial \sigma^{j,\varepsilon}}{\partial \nu} dS \right) = 1.$$

In particular,

$$\sum_{j=1}^2 \int_U (c_{j1} + c_{j2}) \sigma^{j,\varepsilon} dx \leq 1.$$

Proof. First of all, we consider the adjoint of equation (3.4):

$$\begin{cases} D_p H_1(x, Du_1^\varepsilon) \cdot Dz_1 + c_{11}z_1 + c_{12}z_2 - \varepsilon \Delta z_1 = f_1, \\ D_p H_2(x, Du_2^\varepsilon) \cdot Dz_2 + c_{22}z_2 + c_{21}z_1 - \varepsilon \Delta z_2 = f_2, \end{cases} \quad (3.5)$$

where $f_1, f_2 \in C(U)$, with boundary conditions $z_1 = z_2 = 0$ on ∂U . Note that

$$f_1, f_2 \geq 0 \implies \min_{\substack{j=1,2 \\ x \in \bar{U}}} z_j(x) \geq 0. \quad (3.6)$$

Indeed, if the minimum is achieved for some $\bar{x} \in \partial U$, then clearly $z_1, z_2 \geq 0$. Otherwise, assume

$$\min_{\substack{j=1,2 \\ x \in \bar{U}}} z_j(x) = z_1(\bar{x}),$$

for some $\bar{x} \in U$. Using condition (H3.2)

$$(c_{11} + c_{12})z_1(\bar{x}) \geq c_{11}z_1(\bar{x}) + c_{12}z_2(\bar{x}) = \varepsilon \Delta z_1(\bar{x}) + f_1(\bar{x}) \geq 0.$$

Thanks to (H3.3), (3.6) follows.

Let us now multiply (3.4)₁ and (3.4)₂ by the solutions z_1 and z_2 of (3.5). Adding up the relations obtained we have

$$\int_U f_1 \sigma^{1,\varepsilon} dx + \int_U f_2 \sigma^{2,\varepsilon} dx = (2 - i)z_1(x_0) + (1 - i)z_2(x_0).$$

Thanks to (3.6), from last relation we conclude that

$$\int_U f_1 \sigma^{1,\varepsilon} dx + \int_U f_2 \sigma^{2,\varepsilon} dx \geq 0, \quad \text{for every } f_1, f_2 \geq 0,$$

and this implies that $\sigma^{1,\varepsilon}, \sigma^{2,\varepsilon} \geq 0$. To prove (ii), it is sufficient to integrate equations (3.4)₁ and (3.4)₂ over U , and to add up the two relations obtained. \square

The proof of the next lemma can be obtained by arguing as in the proof of Lemma 2.4.

Lemma 3.3. *There exists a constant $C > 0$, independent of ε , such that*

$$\varepsilon \int_U |D^2 u_1^\varepsilon|^2 \sigma^{1,\varepsilon} dx + \varepsilon \int_U |D^2 u_2^\varepsilon|^2 \sigma^{2,\varepsilon} dx \leq C.$$

We now give the last lemma needed to estimate the speed of convergence. Here we use the notation $u_{j,\varepsilon}^\varepsilon(x) := \partial u_j^\varepsilon(x) / \partial \varepsilon$, $j = 1, 2$.

Lemma 3.4. *There exists a constant $C > 0$, independent of ε , such that*

$$\max_{\substack{j=1,2 \\ x \in \bar{U}}} |u_{j,\varepsilon}^\varepsilon(x)| \leq \frac{C}{\varepsilon^{1/2}}.$$

Proof. Differentiating (3.2) w.r.t ε we obtain the system

$$\begin{cases} c_{11}u_{1,\varepsilon}^\varepsilon + c_{12}u_{2,\varepsilon}^\varepsilon + D_p H_1 \cdot Du_{1,\varepsilon}^\varepsilon = \varepsilon \Delta u_{1,\varepsilon}^\varepsilon + \Delta u_1^\varepsilon, \\ c_{21}u_{1,\varepsilon}^\varepsilon + c_{22}u_{2,\varepsilon}^\varepsilon + D_p H_2 \cdot Du_{2,\varepsilon}^\varepsilon = \varepsilon \Delta u_{2,\varepsilon}^\varepsilon + \Delta u_2^\varepsilon. \end{cases} \quad (3.7)$$

Since $u_{1,\varepsilon}^\varepsilon = u_{2,\varepsilon}^\varepsilon = 0$ on ∂U , we have

$$\max_{x \in \partial U} u_{1,\varepsilon}^\varepsilon(x) = \max_{x \in \partial U} u_{2,\varepsilon}^\varepsilon(x) = 0.$$

Assume now that there exists $\widehat{x} \in U$ such that

$$\max_{\substack{j=1,2 \\ x \in \bar{U}}} |u_{j,\varepsilon}^\varepsilon(x)| = |u_{1,\varepsilon}^\varepsilon(\widehat{x})|,$$

and let $\sigma^{1,\varepsilon}, \sigma^{2,\varepsilon}$ be the solutions of system (3.4) with $i = 1$ and $x_0 = \widehat{x}$.

Multiplying equations (3.7)₁ and (3.7)₂ by $\sigma^{1,\varepsilon}$ and $\sigma^{2,\varepsilon}$ respectively and adding up, thanks to (3.4) we obtain

$$u_{1,\varepsilon}^\varepsilon(\widehat{x}) = \int_U \Delta u_1^\varepsilon \sigma^{1,\varepsilon} dx + \int_U \Delta u_2^\varepsilon \sigma^{2,\varepsilon} dx.$$

Thanks to Lemma 3.3, and repeating the chain of inequalities in (2.14) one can show that

$$\left| \int_U \Delta u_j^\varepsilon \sigma^{j,\varepsilon} dx \right| \leq \frac{C}{\varepsilon^{1/2}}, \quad j = 1, 2,$$

and from this the conclusion follows. \square

We can now prove the following result on the speed of convergence.

Theorem 3.5. *There exists $C > 0$, independent of ε , such that*

$$\|u_1^\varepsilon - u_1\|_{L^\infty}, \|u_2^\varepsilon - u_2\|_{L^\infty} \leq C\varepsilon^{1/2}.$$

Proof. The theorem is a direct consequence of Lemma 3.4. \square

4. CELL PROBLEM FOR WEAKLY COUPLED SYSTEMS OF HAMILTON–JACOBI EQUATIONS

In this section we study the following class of weakly coupled systems of Hamilton–Jacobi equations:

$$\begin{cases} c_1 u_1 - c_1 u_2 + H_1(x, Du_1) = \overline{H}_1 \\ -c_2 u_1 + c_2 u_2 + H_2(x, Du_2) = \overline{H}_2 \end{cases} \quad \text{in } \mathbb{T}^n, \quad \overline{H}_1, \overline{H}_2 \in \mathbb{R}, \quad (4.1)$$

which is the analog of the cell problem for single equation introduced by Lions, Papanicolaou, and Varadhan [LPV88]. We will assume that $H_1, H_2 \in C^\infty(\mathbb{T}^n \times \mathbb{R}^n)$, and

(H4.1) there exist $\omega_1, \omega_2 > 0$ such that for every $j = 1, 2$

$$\lim_{|p| \rightarrow +\infty} [\omega_j |H_j(x, p)|^2 + D_x H_j(x, p) \cdot p - 16n\omega_j c_j^2 |p|^2] = +\infty \quad \text{uniformly in } x \in \mathbb{T}^n;$$

(H4.2) $c_1, c_2 > 0$.

It is easy to see that the coefficients of u_1, u_2 in this system do not satisfy the coupling assumptions of the previous section. Indeed, as it happens for the cell problem in the context of weak KAM theory, there is no hope of a uniqueness result for (4.1).

Remark 4.1. *The presence of the term $16n\omega_j c_j^2$ in condition (H4.1) will be justified by later computations. Nevertheless, we observe that (H4.1) is weaker than (H3.1). Indeed, if (H3.1) holds, then for every $\omega_j > \beta_j$*

$$\begin{aligned} & \lim_{|p| \rightarrow +\infty} [\omega_j |H_j(x, p)|^2 + D_x H_j(x, p) \cdot p - 16n\omega_j c_j^2 |p|^2] \\ &= \lim_{|p| \rightarrow +\infty} [\beta_j |H_j(x, p)|^2 + D_x H_j(x, p) \cdot p + (\omega_j - \beta_j) |H_j(x, p)|^2 - 16n\omega_j c_j^2 |p|^2] = +\infty, \end{aligned}$$

uniformly in x , and hence (H4.1) is satisfied.

To find the constants $\overline{H}_1, \overline{H}_2$ we use the same arguments as in [Tra11]. See also [Gom02, CGT11]. First, for every $\varepsilon > 0$, let us consider the following regularized system:

$$\begin{cases} (c_1 + \varepsilon)u_1^\varepsilon - c_1 u_2^\varepsilon + H_1(x, Du_1^\varepsilon) = \varepsilon^2 \Delta u_1^\varepsilon \\ (c_2 + \varepsilon)u_2^\varepsilon - c_2 u_1^\varepsilon + H_2(x, Du_2^\varepsilon) = \varepsilon^2 \Delta u_2^\varepsilon \end{cases} \quad \text{in } \mathbb{T}^n. \quad (4.2)$$

For every $\varepsilon > 0$ fixed, the coefficients of this new system satisfy the coupling assumptions (H3.2) and (H3.3) of the previous section. Thus, (4.2) admits a unique pair of smooth solutions $(u_1^\varepsilon, u_2^\varepsilon)$. In particular, this implies that u_1^ε and u_2^ε are \mathbb{T}^n -periodic.

The following result gives some a priori estimates.

Theorem 4.2. *There exists $C > 0$, independent of ε , such that*

$$\|\varepsilon u_1^\varepsilon\|_{L^\infty}, \|\varepsilon u_2^\varepsilon\|_{L^\infty}, \|Du_1^\varepsilon\|_{L^\infty}, \|Du_2^\varepsilon\|_{L^\infty} \leq C.$$

Proof. Our proof is based on the Maximum Principle. Without loss of generality, we may assume that

$$\max_{\substack{j=1,2 \\ x \in \mathbb{T}^n}} \{\varepsilon u_j^\varepsilon(x)\} = \varepsilon u_1^\varepsilon(x_0^\varepsilon),$$

for some $x_0^\varepsilon \in \mathbb{T}^n$. Applying the Maximum Principle to the first equation of (4.2),

$$\varepsilon u_1^\varepsilon(x_0^\varepsilon) \leq (c_1 + \varepsilon)u_1^\varepsilon(x_0^\varepsilon) - c_1 u_2^\varepsilon(x_0^\varepsilon) \leq -H^1(x_0^\varepsilon, 0) \leq C, \quad (4.3)$$

and this shows the existence of a bound from above for $\varepsilon u_1^\varepsilon$ and $\varepsilon u_2^\varepsilon$. Using a similar argument one can show that there is also a bound from below, so that

$$\|\varepsilon u_1^\varepsilon\|_{L^\infty}, \|\varepsilon u_2^\varepsilon\|_{L^\infty} \leq C. \quad (4.4)$$

The previous inequality allows us to prove a bound for the difference $u_1^\varepsilon(x_0^\varepsilon) - u_2^\varepsilon(x_0^\varepsilon)$. Indeed, thanks to (4.3) and (4.4) we have

$$|u_1^\varepsilon(x_0^\varepsilon) - u_2^\varepsilon(x_0^\varepsilon)| = u_1^\varepsilon(x_0^\varepsilon) - u_2^\varepsilon(x_0^\varepsilon) \leq -\frac{1}{c_1}H_1(x_0^\varepsilon, 0) - \frac{\varepsilon}{c_1}u_1^\varepsilon(x_0^\varepsilon) \leq C. \quad (4.5)$$

In order to find a bound for the gradients, let us set $w_j^\varepsilon = \frac{|Du_j^\varepsilon|^2}{2}$, $j = 1, 2$. Then, by a direct computation one can see that

$$\begin{cases} 2(c_1 + \varepsilon)w_1^\varepsilon + D_p H_1 \cdot Dw_1^\varepsilon - c_1 Du_1^\varepsilon \cdot Du_2^\varepsilon + D_x H_1 \cdot Du_1^\varepsilon = \varepsilon^2 \Delta w_1^\varepsilon - \varepsilon^2 |D^2 u_1^\varepsilon|^2 \\ 2(c_2 + \varepsilon)w_2^\varepsilon + D_p H_2 \cdot Dw_2^\varepsilon - c_2 Du_1^\varepsilon \cdot Du_2^\varepsilon + D_x H_2 \cdot Du_2^\varepsilon = \varepsilon^2 \Delta w_2^\varepsilon - \varepsilon^2 |D^2 u_2^\varepsilon|^2 \end{cases} \quad \text{in } \mathbb{T}^n.$$

Without loss of generality, we may assume that there exists $x_1^\varepsilon \in \mathbb{T}^n$ such that

$$\max_{\substack{j=1,2 \\ x \in \mathbb{T}^n}} \{w_j^\varepsilon(x)\} = w_1^\varepsilon(x_1^\varepsilon).$$

Then, by the Maximum Principle

$$\begin{aligned} \varepsilon^2 |D^2 u_1^\varepsilon(x_1^\varepsilon)|^2 &\leq -2(c_1 + \varepsilon)w_1^\varepsilon(x_1^\varepsilon) + c_1 Du_1^\varepsilon(x_1^\varepsilon) \cdot Du_2^\varepsilon(x_1^\varepsilon) - D_x H_1 \cdot Du_1^\varepsilon(x_1^\varepsilon) \\ &\leq -D_x H_1 \cdot Du_1^\varepsilon(x_1^\varepsilon). \end{aligned} \quad (4.6)$$

Moreover, for ε sufficiently small

$$\varepsilon^2 |D^2 u_1^\varepsilon(x_1^\varepsilon)|^2 \geq 2\omega_1 \varepsilon^4 (\Delta u_1^\varepsilon(x_1^\varepsilon))^2 = 2\omega_1 [H_1(x_1^\varepsilon, Du_1^\varepsilon(x_1^\varepsilon)) + (c_1 + \varepsilon)u_1^\varepsilon(x_1^\varepsilon) - c_1 u_2^\varepsilon(x_1^\varepsilon)]^2. \quad (4.7)$$

Also, thanks to (4.4) and (4.5)

$$\begin{aligned} &|(c_1 + \varepsilon)u_1^\varepsilon(x_1^\varepsilon) - c_1 u_2^\varepsilon(x_1^\varepsilon)| \\ &\leq \varepsilon |u_1^\varepsilon(x_1^\varepsilon)| + c_1 |u_1^\varepsilon(x_1^\varepsilon) - u_1^\varepsilon(x_0^\varepsilon)| + c_1 |u_2^\varepsilon(x_1^\varepsilon) - u_2^\varepsilon(x_0^\varepsilon)| + c_1 |u_1^\varepsilon(x_0^\varepsilon) - u_2^\varepsilon(x_0^\varepsilon)| \\ &\leq C + c_1 |u_1^\varepsilon(x_1^\varepsilon) - u_1^\varepsilon(x_0^\varepsilon)| + c_1 |u_2^\varepsilon(x_1^\varepsilon) - u_2^\varepsilon(x_0^\varepsilon)| \\ &\leq C + 2c_1 |Du_1^\varepsilon(x_1^\varepsilon)| |x_1^\varepsilon - x_0^\varepsilon| \leq C + 2c_1 \sqrt{n} |Du_1^\varepsilon(x_1^\varepsilon)|, \end{aligned}$$

where we used the fact that the diameter of \mathbb{T}^n is \sqrt{n} . Last relation, thanks to (4.7) and Young's inequality, gives that

$$\begin{aligned} \varepsilon^2 |D^2 u_1^\varepsilon(x_1^\varepsilon)|^2 &\geq 2\omega_1 [H_1(x_1^\varepsilon, Du_1^\varepsilon(x_1^\varepsilon)) + (c_1 + \varepsilon)u_1^\varepsilon(x_1^\varepsilon) - c_1 u_2^\varepsilon(x_1^\varepsilon)]^2 \\ &\geq \omega_1 |H_1(x_1^\varepsilon, Du_1^\varepsilon(x_1^\varepsilon))|^2 - 2\omega_1 [(c_1 + \varepsilon)u_1^\varepsilon(x_1^\varepsilon) - c_1 u_2^\varepsilon(x_1^\varepsilon)]^2 \\ &\geq \omega_1 |H_1(x_1^\varepsilon, Du_1^\varepsilon(x_1^\varepsilon))|^2 - 2\omega_1 [C + 2c_1 \sqrt{n} |Du_1^\varepsilon(x_1^\varepsilon)|]^2 \\ &\geq \omega_1 |H_1(x_1^\varepsilon, Du_1^\varepsilon(x_1^\varepsilon))|^2 - C - 16n\omega_1 c_1^2 |Du_1^\varepsilon(x_1^\varepsilon)|^2, \end{aligned}$$

Using last inequality and (4.6) we have

$$\omega_1 |H_1(x_1, Du_1^\varepsilon(x_1^\varepsilon))|^2 + D_x H_1 \cdot Du_1^\varepsilon(x_1^\varepsilon) - 16n\omega_1 c_1^2 |Du_1^\varepsilon(x_1^\varepsilon)|^2 \leq C.$$

Thanks to condition (H4.1), we obtain the conclusion. \square

In the sequel, all the functions will be regarded as functions defined in the whole \mathbb{R}^n and \mathbb{Z}^n -periodic. Next lemma provides some a priori bounds on u_1^ε and u_2^ε .

Lemma 4.3. *There exists a constant $C > 0$, independent of ε , such that*

$$|u_1^\varepsilon(x) - u_1^\varepsilon(y)|, |u_2^\varepsilon(x) - u_2^\varepsilon(y)|, |u_1^\varepsilon(x) - u_2^\varepsilon(y)| \leq C, \quad x, y \in \mathbb{R}^n.$$

Proof. The first two inequalities follow from the periodicity of u_1^ε and u_2^ε , and from the fact that Du_1^ε and Du_2^ε are bounded.

Let us now show the last inequality. As in the previous proof, without loss of generality we may assume that there exists $x_0^\varepsilon \in \mathbb{T}^n$ such that

$$\max_{\substack{j=1,2 \\ x \in \mathbb{T}^n}} \{u_j^\varepsilon(x)\} = u_1^\varepsilon(x_0^\varepsilon).$$

Combining the second inequality of the lemma with (4.3),

$$u_1^\varepsilon(x) - u_2^\varepsilon(y) \leq u_1^\varepsilon(x_0^\varepsilon) - u_2^\varepsilon(x_0^\varepsilon) + u_2^\varepsilon(x_0^\varepsilon) - u_2^\varepsilon(y) \leq C, \quad x, y \in \mathbb{R}^n.$$

The proof can be concluded by repeating the same argument for $\min_{\substack{j=1,2 \\ x \in \mathbb{T}^n}} \{u_j^\varepsilon(x)\}$. \square

Proof of Theorem 1.2. Thanks to Theorem 4.2 and Lemma 4.3,

$$\varepsilon u_i^\varepsilon \rightarrow \overline{C} \quad \text{uniformly in } \mathbb{T}^n, \text{ for } i = 1, 2, \quad (4.8)$$

for some constant $\overline{C} \in \mathbb{R}$. Furthermore, still up to subsequences,

$$\begin{cases} u_1^\varepsilon - \min_{\mathbb{T}^n} u_1^\varepsilon \rightarrow u_1, \\ u_2^\varepsilon - \min_{\mathbb{T}^n} u_2^\varepsilon \rightarrow u_2, \end{cases} \quad \text{and} \quad \begin{cases} -\varepsilon u_1^\varepsilon + c_1(\min_{\mathbb{T}^n} u_1^\varepsilon - \min_{\mathbb{T}^n} u_2^\varepsilon) \rightarrow \overline{H}_1, \\ -\varepsilon u_2^\varepsilon + c_2(\min_{\mathbb{T}^n} u_2^\varepsilon - \min_{\mathbb{T}^n} u_1^\varepsilon) \rightarrow \overline{H}_2, \end{cases} \quad (4.9)$$

uniformly in \mathbb{T}^n , for some functions $u_1, u_2 \in C(\mathbb{T}^n)$ and some constants $\overline{H}_1, \overline{H}_2 \in \mathbb{R}$. From (4.9) it follows that the functions (u_1, u_2) and the constants $(\overline{H}_1, \overline{H}_2)$ are such that (4.1) holds, in the viscosity sense. \square

Remark 4.4. *In general, \overline{H}_1 and \overline{H}_2 are not unique. Indeed, let (u_1, u_2) be a viscosity solution of (4.1). Then, for every pair of constants (C_1, C_2) , the pair of functions $(\tilde{u}_1, \tilde{u}_2)$ where $\tilde{u}_1 := u_1 + C_1$ and $\tilde{u}_2 := u_2 + C_2$ is still a viscosity solution of (4.1), with*

$$\tilde{H}_1 := \overline{H}_1 + c_1(C_1 - C_2), \quad \tilde{H}_2 := \overline{H}_2 + c_2(C_2 - C_1),$$

in place of \overline{H}_1 and \overline{H}_2 , respectively. Anyway, we have $c_2\overline{H}_1 + c_1\overline{H}_2 = c_2\tilde{H}_1 + c_1\tilde{H}_2$. This suggests that, although \overline{H}_1 and \overline{H}_2 may vary, the expression $c_2\overline{H}_1 + c_1\overline{H}_2$ is unique. Theorem 1.3 shows that this is the case.

Proof of Theorem 1.3. Without loss of generality, we may assume $c_1 = c_2 = 1$. Suppose, by contradiction, that there exist two pairs $(\lambda_1, \lambda_2) \in \mathbb{R}^2$ and $(\mu_1, \mu_2) \in \mathbb{R}^2$, and four functions $u_1, u_2, \tilde{u}_1, \tilde{u}_2 \in C(\mathbb{T}^n)$ such that $\lambda_1 + \lambda_2 < \mu_1 + \mu_2$ and

$$\begin{cases} u_1 - u_2 + H_1(x, Du_1) = \lambda_1 \\ -u_1 + u_2 + H_2(x, Du_2) = \lambda_2 \end{cases} \quad \text{in } \mathbb{T}^n,$$

and

$$\begin{cases} \tilde{u}_1 - \tilde{u}_2 + H_1(x, D\tilde{u}_1) = \mu_1 \\ -\tilde{u}_1 + \tilde{u}_2 + H_2(x, D\tilde{u}_2) = \mu_2 \end{cases} \quad \text{in } \mathbb{T}^n.$$

By possibly substituting u_1 and u_2 with functions $\hat{u}_1 := u_1 + C_1$ and $\hat{u}_2 := u_2 + C_2$, for suitable constants C_1 and C_2 , we may always assume that $\lambda_1 < \mu_1, \lambda_2 < \mu_2$.

In the same way, by a further substitution $\bar{u}_1 := u_1 + C_3$, $\bar{u}_2 := u_2 + C_3$, with $C_3 > 0$ large enough, we may assume that $u_1 > \tilde{u}_1, u_2 > \tilde{u}_2$. Then, there exists $\varepsilon > 0$ small enough such that

$$\begin{cases} (\varepsilon + 1)u_1 - u_2 + H_1(x, Du_1) < (\varepsilon + 1)\tilde{u}_1 - \tilde{u}_2 + H_1(x, D\tilde{u}_1) \\ (\varepsilon + 1)u_2 - u_1 + H_2(x, Du_2) < (\varepsilon + 1)\tilde{u}_2 - \tilde{u}_1 + H_2(x, D\tilde{u}_2) \end{cases} \quad \text{in } \mathbb{T}^n.$$

Observe that the coefficients of the last system satisfy the coupling assumptions (H3.2) and (H3.3). Hence, applying the Comparison Principle in [EL91] and [IK91], we conclude that $u_1 < \tilde{u}_1$ and $u_2 < \tilde{u}_2$, which gives a contradiction. \square

Remark 4.5. *Multiplying the two convergences in the right in (4.9) by c_2 and c_1 , respectively, one can see that*

$$-\bar{C} = \bar{H} = \frac{\mu}{c_1 + c_2}.$$

Here, \bar{C} is defined in (4.8), μ given by Theorem 1.3, and \bar{H} is the unique constant such that (1.9) has viscosity solutions. We call \bar{H} the effective Hamiltonian of the cell problem for the weakly coupled system of Hamilton–Jacobi equations.

The following is the main theorem of the section. See also [Tra11] for similar results.

Theorem 4.6. *There exists a constant $C > 0$, independent of ε , such that*

$$\|\varepsilon u_i^\varepsilon + \bar{H}\|_{L^\infty} \leq C\varepsilon, \quad \text{for } i = 1, 2.$$

Adjoint method: Also in this case, we introduce the adjoint equations associated to the linearization of the original problem. We look for $\sigma^{1,\varepsilon}, \sigma^{2,\varepsilon}$ which are \mathbb{T}^n -periodic and such that

$$\begin{cases} -\operatorname{div}(D_p H_1 \sigma^{1,\varepsilon}) + (c_1 + \varepsilon)\sigma^{1,\varepsilon} - c_2 \sigma^{2,\varepsilon} = \varepsilon^2 \Delta \sigma^{1,\varepsilon} + \varepsilon(2 - i)\delta_{x_0} & \text{in } \mathbb{T}^n, \\ -\operatorname{div}(D_p H_2 \sigma^{2,\varepsilon}) + (c_2 + \varepsilon)\sigma^{2,\varepsilon} - c_1 \sigma^{1,\varepsilon} = \varepsilon^2 \Delta \sigma^{2,\varepsilon} + \varepsilon(i - 1)\delta_{x_0} & \text{in } \mathbb{T}^n, \end{cases} \quad (4.10)$$

where $i \in \{1, 2\}$ and $x_0 \in \mathbb{T}^n$ will be chosen later. The argument used in Section 2 gives also in this case existence and uniqueness for $\sigma^{1,\varepsilon}$ and $\sigma^{2,\varepsilon}$. As before, we also have $\sigma^{1,\varepsilon}, \sigma^{2,\varepsilon} \in C^\infty(\mathbb{T}^n \setminus \{x_0\})$. The next two lemmas can be proven as Lemma 3.2 and Lemma 3.3, respectively.

Lemma 4.7 (Properties of $\sigma^{1,\varepsilon}, \sigma^{2,\varepsilon}$). *The functions $\sigma^{1,\varepsilon}, \sigma^{2,\varepsilon}$ satisfy the following:*

- (i) $\sigma^{j,\varepsilon} \geq 0$ on \mathbb{T}^n ($j = 1, 2$);
- (ii) Moreover, the following equality holds:

$$\sum_{j=1}^2 \int_{\mathbb{T}^n} \sigma^{j,\varepsilon} dx = 1.$$

Lemma 4.8. *There exists a constant $C > 0$, independent of ε , such that*

$$\varepsilon^2 \int_{\mathbb{R}^n} |D^2 u_1^\varepsilon|^2 \sigma^{1,\varepsilon} dx \leq C,$$

$$\varepsilon^2 \int_{\mathbb{R}^n} |D^2 u_2^\varepsilon|^2 \sigma^{2,\varepsilon} dx \leq C.$$

Finally, next lemma allows us to prove Theorem 4.6.

Lemma 4.9. *There exists a constant $C > 0$, independent of ε , such that*

$$\max_{\mathbb{T}^n} |(\varepsilon u_1^\varepsilon)_\varepsilon|, \quad \max_{\mathbb{T}^n} |(\varepsilon u_2^\varepsilon)_\varepsilon| \leq C.$$

Proof. Differentiating (4.2) w.r.t. ε ,

$$\begin{cases} D_p H_1 \cdot Du_{1,\varepsilon}^\varepsilon + (c_1 + \varepsilon)u_{1,\varepsilon}^\varepsilon + u_1^\varepsilon - c_1 u_{2,\varepsilon}^\varepsilon = \varepsilon^2 \Delta u_{1,\varepsilon}^\varepsilon + 2\varepsilon \Delta u_1^\varepsilon, \\ D_p H_2 \cdot Du_{2,\varepsilon}^\varepsilon + (c_2 + \varepsilon)u_{2,\varepsilon}^\varepsilon + u_2^\varepsilon - c_2 u_{1,\varepsilon}^\varepsilon = \varepsilon^2 \Delta u_{2,\varepsilon}^\varepsilon + 2\varepsilon \Delta u_2^\varepsilon, \end{cases}$$

where we set $u_{j,\varepsilon}^\varepsilon := \partial u_j^\varepsilon / \partial \varepsilon$, $j = 1, 2$. Without loss of generality, we may assume that there exists $x_2 \in \mathbb{T}^n$ such that

$$\max_{\substack{j=1,2 \\ x \in \mathbb{T}^n}} (\varepsilon u_j^\varepsilon(x))_\varepsilon = \max_{\substack{j=1,2 \\ x \in \mathbb{T}^n}} \{ \varepsilon u_{j,\varepsilon}^\varepsilon(x) + u_j^\varepsilon(x) \} = \varepsilon u_{1,\varepsilon}^\varepsilon(x_2) + u_1^\varepsilon(x_2).$$

Choosing $x_0 = x_2$ in the adjoint equation (4.10), and repeating the steps in the proof of Theorem 2.5, we get

$$\begin{aligned} & \varepsilon u_{1,\varepsilon}^\varepsilon(x_2) + \int_{\mathbb{T}^n} u_1^\varepsilon \sigma^{1,\varepsilon} dx + \int_{\mathbb{T}^n} u_2^\varepsilon \sigma^{2,\varepsilon} dx \\ & \leq 2\varepsilon \int_{\mathbb{T}^n} |\Delta u_1^\varepsilon| \sigma^{1,\varepsilon} dx + 2\varepsilon \int_{\mathbb{T}^n} |\Delta u_2^\varepsilon| \sigma^{2,\varepsilon} dx \leq C, \end{aligned} \tag{4.11}$$

where the latter inequality follows by repeating the chain of inequalities in (2.14) and thanks to Lemma 4.8. Using Lemma 4.3 and property (ii) of Lemma 4.7 we have

$$\begin{aligned} & \left| \int_{\mathbb{T}^n} u_1^\varepsilon(x) \sigma^{1,\varepsilon} dx + \int_{\mathbb{T}^n} u_2^\varepsilon(x) \sigma^{2,\varepsilon} dx - u_1^\varepsilon(x_2) \right| \\ &= \left| \int_{\mathbb{T}^n} (u_1^\varepsilon(x) - u_1^\varepsilon(x_2)) \sigma^{1,\varepsilon} dx + \int_{\mathbb{T}^n} (u_2^\varepsilon(x) - u_1^\varepsilon(x_2)) \sigma^{2,\varepsilon} dx \right| \leq C. \end{aligned}$$

In view of the previous inequality, (4.11) becomes

$$\varepsilon u_{1,\varepsilon}^\varepsilon(x_2) + u_1^\varepsilon(x_2) \leq C,$$

thus giving the bound from above. The same argument, applied to $\min_{j=1,2} (\varepsilon u_j^\varepsilon(x))_\varepsilon$, allows to prove the bound from below. \square

Proof of Theorem 4.6. The theorem immediately follows by using Lemma 4.9. \square

Remark 4.10. (i). In order to achieve existence and uniqueness of the effective Hamiltonian \overline{H} one can require either (H4.1) or the usual coercive assumption (i.e. H_1, H_2 are uniformly coercive in p). Indeed one can consider the regularized system

$$\begin{cases} (c_1 + \varepsilon)u_1^\varepsilon - c_1 u_2^\varepsilon + H_1(x, Du_1^\varepsilon) = 0 \\ (c_2 + \varepsilon)u_2^\varepsilon - c_2 u_1^\varepsilon + H_2(x, Du_2^\varepsilon) = 0 \end{cases} \quad \text{in } \mathbb{T}^n, \quad (4.12)$$

and derive the results similarly to what we did above by using the coercivity of H_1, H_2 . We require (H4.1) in order to get the speed of convergence as in Theorem 4.6.

(ii). By using the same arguments, we can show that for any $P \in \mathbb{R}^n$, there exist a pair of constants $(\overline{H}_1(P), \overline{H}_2(P))$ such that the system

$$\begin{cases} c_1 u_1 - c_1 u_2 + H_1(x, P + Du_1) = \overline{H}_1(P) \\ c_2 u_2 - c_2 u_1 + H_2(x, P + Du_2) = \overline{H}_2(P) \end{cases} \quad \text{in } \mathbb{T}^n,$$

admits a solution $(u_1(\cdot, P), u_2(\cdot, P)) \in C(\mathbb{T}^n)^2$. Moreover $\overline{H}(P)$, the effective Hamiltonian, is unique and

$$\overline{H}(P) = \frac{c_2 \overline{H}_1(P) + c_1 \overline{H}_2(P)}{c_1 + c_2}.$$

5. WEAKLY COUPLED SYSTEMS OF OBSTACLE TYPE

In this last section we apply the Adjoint Method to weakly coupled systems of obstacle type. Let $H_1, H_2 : \overline{U} \times \mathbb{R}^n \rightarrow \mathbb{R}$ be smooth Hamiltonians, and let $\psi_1, \psi_2 : \overline{U} \rightarrow \mathbb{R}$ be smooth functions describing the obstacles. We assume that there exists $\alpha > 0$ such that

$$\psi_1, \psi_2 \geq \alpha \quad \text{in } \overline{U}, \quad (5.1)$$

and consider the system

$$\begin{cases} \max\{u_1 - u_2 - \psi_1, u_1 + H_1(x, Du_1)\} = 0 & \text{in } U, \\ \max\{u_2 - u_1 - \psi_2, u_2 + H_2(x, Du_2)\} = 0 & \text{in } U, \end{cases} \quad (5.2)$$

with boundary conditions $u_1|_{\partial U} = u_2|_{\partial U} = 0$. We observe that (5.1) guarantees the compatibility of the boundary conditions, since $\psi_1, \psi_2 > 0$ on ∂U .

Although the two equations in (5.2) are coupled just through the difference $u_1 - u_2$, this problem turns out to be more difficult than the correspondent scalar equation (2.1) studied in Section 2. For this reason, the hypotheses we require now are stronger. We assume that

(H5.1) $H_j(x, \cdot)$ is convex for every $x \in \overline{U}$, $j = 1, 2$.

(H5.2) Superlinearity in p :

$$\lim_{|p| \rightarrow \infty} \frac{H_j(x, p)}{|p|} = +\infty \quad \text{uniformly in } x, \quad j = 1, 2.$$

(H5.3) $|D_x H_j(x, p)| \leq C$ for each $(x, p) \in \overline{U} \times \mathbb{R}^n$, $j = 1, 2$.

(H5.4) There exist $\Phi_1, \Phi_2 \in C^2(U) \cap C^1(\overline{U})$ with $\Phi_j = 0$ on ∂U ($j = 1, 2$), $-\psi_2 \leq \Phi_1 - \Phi_2 \leq \psi_1$, and such that

$$\Phi_j + H_j(x, D\Phi_j) < 0 \quad \text{in } \overline{U} \quad (j = 1, 2).$$

Let $\varepsilon > 0$ and let $\gamma^\varepsilon : \mathbb{R} \rightarrow [0, +\infty)$ be the function defined by (1.2). We make in this section the additional assumption that γ is convex. We approximate (5.2) by the following system

$$\begin{cases} u_1^\varepsilon + H_1(x, Du_1^\varepsilon) + \gamma^\varepsilon(u_1^\varepsilon - u_2^\varepsilon - \psi_1) = \varepsilon \Delta u_1^\varepsilon & \text{in } U, \\ u_2^\varepsilon + H_2(x, Du_2^\varepsilon) + \gamma^\varepsilon(u_2^\varepsilon - u_1^\varepsilon - \psi_2) = \varepsilon \Delta u_2^\varepsilon & \text{in } U. \end{cases} \quad (5.3)$$

We are now ready to state the main result of the section.

Theorem 5.1. *There exists a positive constant C , independent of ε , such that*

$$\|u_i^\varepsilon - u_i\|_{L^\infty} \leq C\varepsilon^{1/2}, \quad \text{for } i = 1, 2.$$

In order to prove the theorem we need several lemmas. In the sequel, we shall use the notation

$$\theta_1^\varepsilon := u_1^\varepsilon - u_2^\varepsilon - \psi_1, \quad \theta_2^\varepsilon := u_2^\varepsilon - u_1^\varepsilon - \psi_2.$$

The linearized operator corresponding to (5.3) is

$$L^\varepsilon(z_1, z_2) := \begin{cases} z_1 + D_p H_1(x, Du_1^\varepsilon) \cdot Dz_1 + (\gamma^\varepsilon)'|_{\theta_1^\varepsilon} (z_1 - z_2) - \varepsilon \Delta z_1, \\ z_2 + D_p H_2(x, Du_2^\varepsilon) \cdot Dz_2 + (\gamma^\varepsilon)'|_{\theta_2^\varepsilon} (z_2 - z_1) - \varepsilon \Delta z_2. \end{cases}$$

Then, the adjoint equations are:

$$\begin{cases} (1 + (\gamma^\varepsilon)' |_{\theta_1^\varepsilon}) \sigma^{1,\varepsilon} - \operatorname{div}(D_p H_1 \sigma^{1,\varepsilon}) - (\gamma^\varepsilon)' |_{\theta_2^\varepsilon} \sigma^{2,\varepsilon} = \varepsilon \Delta \sigma^{1,\varepsilon} + (2 - i) \delta_{x_0} & \text{in } U, \\ (1 + (\gamma^\varepsilon)' |_{\theta_2^\varepsilon}) \sigma^{2,\varepsilon} - \operatorname{div}(D_p H_2 \sigma^{2,\varepsilon}) - (\gamma^\varepsilon)' |_{\theta_1^\varepsilon} \sigma^{1,\varepsilon} = \varepsilon \Delta \sigma^{2,\varepsilon} + (i - 1) \delta_{x_0} & \text{in } U, \end{cases} \quad (5.4)$$

with boundary conditions

$$\begin{cases} \sigma^{1,\varepsilon} = 0 & \text{on } \partial U, \\ \sigma^{2,\varepsilon} = 0 & \text{on } \partial U, \end{cases}$$

where $i \in \{1, 2\}$ and $x_0 \in U$ will be chosen later. By repeating what was done in Section 2, we get the existence and uniqueness of $\sigma^{1,\varepsilon}$ and $\sigma^{2,\varepsilon}$ by Fredholm alternative. Furthermore, $\sigma^{1,\varepsilon}$ and $\sigma^{2,\varepsilon}$ are well defined and $\sigma^{1,\varepsilon}, \sigma^{2,\varepsilon} \in C^\infty(U \setminus \{x_0\})$. In order to derive further properties of $\sigma^{1,\varepsilon}$ and $\sigma^{2,\varepsilon}$, we need the following useful formulas.

Lemma 5.2. *For every $\varphi_1, \varphi_2 \in C^2(\overline{U})$ we have*

$$\begin{aligned} (2 - i) \varphi_1(x_0) = & -\varepsilon \int_{\partial U} \frac{\partial \sigma^{1,\varepsilon}}{\partial \nu} \varphi_1 dS - \int_U (\gamma^\varepsilon)' |_{\theta_2^\varepsilon} \varphi_1 \sigma^{2,\varepsilon} dx \\ & + \int_U [(1 + (\gamma^\varepsilon)' |_{\theta_1^\varepsilon}) \varphi_1 + D_p H_1 \cdot D \varphi_1 - \varepsilon \Delta \varphi_1] \sigma^{1,\varepsilon} dx, \end{aligned} \quad (5.5)$$

and

$$\begin{aligned} (i - 1) \varphi_2(x_0) = & -\varepsilon \int_{\partial U} \frac{\partial \sigma^{2,\varepsilon}}{\partial \nu} \varphi_2 dS - \int_U (\gamma^\varepsilon)' |_{\theta_1^\varepsilon} \varphi_2 \sigma^{1,\varepsilon} dx \\ & + \int_U [(1 + (\gamma^\varepsilon)' |_{\theta_2^\varepsilon}) \varphi_2 + D_p H_2 \cdot D \varphi_2 - \varepsilon \Delta \varphi_2] \sigma^{2,\varepsilon} dx, \end{aligned} \quad (5.6)$$

where ν is the outer unit normal to ∂U .

Proof. The conclusion follows by simply multiplying by φ_j ($j = 1, 2$) the two equations in (5.4) and integrating by parts. \square

From the previous lemma, the analogous of Lemma 2.3 follows.

Lemma 5.3 (Properties of $\sigma^{1,\varepsilon}, \sigma^{2,\varepsilon}$). *Let ν be the outer unit normal to ∂U . Then*

- (i) $\sigma^{j,\varepsilon} \geq 0$ on \overline{U} . In particular, $\frac{\partial \sigma^{j,\varepsilon}}{\partial \nu} \leq 0$ on ∂U ($j = 1, 2$).
- (ii) The following equality holds:

$$\sum_{j=1}^2 \left(\int_U \sigma^{j,\varepsilon} dx - \varepsilon \int_{\partial U} \frac{\partial \sigma^{j,\varepsilon}}{\partial \nu} dS \right) = 1.$$

In particular,

$$\sum_{j=1}^2 \int_U \sigma^{j,\varepsilon} dx \leq 1.$$

We are now able to prove a uniform bound on u_1^ε and u_2^ε . The proof is skipped, since it is analogous to those of the previous sections.

Lemma 5.4. *There exists a positive constant C , independent of ε , such that*

$$\|u_1^\varepsilon\|_{L^\infty}, \|u_2^\varepsilon\|_{L^\infty} \leq C.$$

Next lemma will be used to give a uniform bound for Du_1^ε and Du_2^ε .

Lemma 5.5. *We have*

$$\int_U (\gamma^\varepsilon)' |_{\theta_\varepsilon^1} \sigma^{1,\varepsilon} dx + \int_U (\gamma^\varepsilon)' |_{\theta_\varepsilon^2} \sigma^{2,\varepsilon} dx \leq C,$$

where C is a positive constant independent of ε .

Proof. First of all, observe that condition (H5.1) implies that

$$H_j(x, p) - D_p H_j(x, p) \cdot p \leq H_j(x, 0), \quad \text{for every } (x, p) \in \overline{U} \times \mathbb{R}^n, \quad j = 1, 2. \quad (5.7)$$

In the same way, the convexity of γ implies

$$\gamma^\varepsilon(s) - [(\gamma^\varepsilon)'(s)] s = \gamma\left(\frac{s}{\varepsilon}\right) - \left[(\gamma')\left(\frac{s}{\varepsilon}\right)\right] \frac{s}{\varepsilon} \leq \gamma(0) = 0. \quad (5.8)$$

Equation (5.3)₁ gives

$$\begin{aligned} 0 &= u_1^\varepsilon + H_1(x, Du_1^\varepsilon) + \gamma^\varepsilon |_{\theta_\varepsilon^1} - \varepsilon \Delta u_1^\varepsilon \\ &= u_1^\varepsilon + D_p H_1(x, Du_1^\varepsilon) \cdot Du_1^\varepsilon - \varepsilon \Delta u_1^\varepsilon + H_1(x, Du_1^\varepsilon) - D_p H_1(x, Du_1^\varepsilon) \cdot Du_1^\varepsilon \\ &\quad + \gamma^\varepsilon |_{\theta_\varepsilon^1} - (\gamma^\varepsilon)' |_{\theta_\varepsilon^1} \theta_\varepsilon^1 + (\gamma^\varepsilon)' |_{\theta_\varepsilon^1} (u_1^\varepsilon - u_2^\varepsilon) - (\gamma^\varepsilon)' |_{\theta_\varepsilon^1} \psi_1. \end{aligned}$$

Multiplying last relation by $\sigma^{1,\varepsilon}$, integrating and using (5.7) and (5.8)

$$\begin{aligned} \int_U (\gamma^\varepsilon)' |_{\theta_\varepsilon^1} \psi_1 \sigma^{1,\varepsilon} dx &= \int_U [H_1(x, Du_1^\varepsilon) - D_p H_1(x, Du_1^\varepsilon) \cdot Du_1^\varepsilon] \sigma^{1,\varepsilon} dx \\ &\quad + \int_U [\gamma^\varepsilon |_{\theta_\varepsilon^1} - (\gamma^\varepsilon)' |_{\theta_\varepsilon^1} \theta_\varepsilon^1] \sigma^{1,\varepsilon} dx \\ &\quad + \int_U [(1 + (\gamma^\varepsilon)' |_{\theta_\varepsilon^1}) u_1^\varepsilon + D_p H_1(x, Du_1^\varepsilon) \cdot Du_1^\varepsilon - \varepsilon \Delta u_1^\varepsilon - (\gamma^\varepsilon)' |_{\theta_\varepsilon^1} u_2^\varepsilon] \sigma^{1,\varepsilon} dx \\ &\leq \int_U H_1(x, 0) \sigma^{1,\varepsilon} dx \\ &\quad + \int_U [(1 + (\gamma^\varepsilon)' |_{\theta_\varepsilon^1}) u_1^\varepsilon + D_p H_1(x, Du_1^\varepsilon) \cdot Du_1^\varepsilon - \varepsilon \Delta u_1^\varepsilon - (\gamma^\varepsilon)' |_{\theta_\varepsilon^1} u_2^\varepsilon] \sigma^{1,\varepsilon} dx. \end{aligned}$$

Analogously,

$$\begin{aligned} \int_U (\gamma^\varepsilon)' |_{\theta_\varepsilon^2} \psi_2 \sigma^{2,\varepsilon} dx &\leq \int_U H_2(x, 0) \sigma^{2,\varepsilon} dx \\ &\quad + \int_U [(1 + (\gamma^\varepsilon)' |_{\theta_\varepsilon^2}) u_2^\varepsilon + D_p H_2(x, Du_2^\varepsilon) \cdot Du_2^\varepsilon - \varepsilon \Delta u_2^\varepsilon - (\gamma^\varepsilon)' |_{\theta_\varepsilon^2} u_1^\varepsilon] \sigma^{2,\varepsilon} dx. \end{aligned}$$

Summing up the last two relations and using (5.5) and (5.6)

$$\begin{aligned} \int_U (\gamma^\varepsilon)' |_{\theta_\varepsilon^1} \psi_1 \sigma^{1,\varepsilon} dx + \int_U (\gamma^\varepsilon)' |_{\theta_\varepsilon^2} \psi_2 \sigma^{2,\varepsilon} dx &\leq (2-i)u_1^\varepsilon(x_0) + (i-1)u_2^\varepsilon(x_0) \\ &+ \|H_1(\cdot, 0)\|_{L^\infty} \int_U \sigma^{1,\varepsilon} dx + \|H_2(\cdot, 0)\|_{L^\infty} \int_U \sigma^{2,\varepsilon} dx. \end{aligned}$$

Thus,

$$\begin{aligned} \int_U (\gamma^\varepsilon)' |_{\theta_\varepsilon^1} \sigma^{1,\varepsilon} dx + \int_U (\gamma^\varepsilon)' |_{\theta_\varepsilon^2} \sigma^{2,\varepsilon} dx &\leq \frac{2-i}{\alpha} u_1^\varepsilon(x_0) + \frac{i-1}{\alpha} u_2^\varepsilon(x_0) \\ &+ \frac{\|H_1(\cdot, 0)\|_{L^\infty}}{\alpha} \int_U \sigma^{1,\varepsilon} dx + \frac{\|H_2(\cdot, 0)\|_{L^\infty}}{\alpha} \int_U \sigma^{2,\varepsilon} dx \leq C, \end{aligned}$$

where we used (5.1), Lemma 5.3 and Lemma 5.4. \square

We can finally show the existence of a uniform bound for the gradients of u_1^ε and u_2^ε .

Lemma 5.6. *There exists a positive constant C , independent of ε , such that*

$$\|Du_1^\varepsilon\|_{L^\infty}, \|Du_2^\varepsilon\|_{L^\infty} \leq C.$$

Proof. Step I: Bound on ∂U .

As it was done in Section 2, we are going to construct appropriate barriers. For ε small enough, assumption (H5.4) implies that

$$\begin{cases} \Phi_1 + H_1(x, D\Phi_1) + \gamma^\varepsilon(\Phi_1 - \Phi_2 - \psi_1) < \varepsilon \Delta \Phi_1 & \text{in } U, \\ \Phi_2 + H_2(x, D\Phi_2) + \gamma^\varepsilon(\Phi_2 - \Phi_1 - \psi_2) < \varepsilon \Delta \Phi_2 & \text{in } U, \end{cases}$$

and $\Phi_1 = \Phi_2 = 0$ on ∂U . Therefore, (Φ_1, Φ_2) is a sub-solution of (5.3). By the comparison principle, $u_j^\varepsilon \geq \Phi_j$ in U , $j = 1, 2$.

Let $d(x)$, δ , and U_δ be as in the proof of Proposition 2.1. For $\mu > 0$ large enough, the uniform bounds of $\|u_1^\varepsilon\|_{L^\infty}$ and $\|u_2^\varepsilon\|_{L^\infty}$ yield $v := \mu d \geq u_j^\varepsilon$ on ∂U_δ , $j = 1, 2$, so that

$$\begin{cases} v + H_1(x, Dv) + \gamma^\varepsilon(v - v - \psi_1) - \varepsilon \Delta v = v + H_1(x, Dv) - \varepsilon \Delta v \geq H_1(x, \mu Dd) - \mu C & \text{in } U, \\ v + H_2(x, Dv) + \gamma^\varepsilon(v - v - \psi_2) - \varepsilon \Delta v = v + H_2(x, Dv) - \varepsilon \Delta v \geq H_2(x, \mu Dd) - \mu C & \text{in } U. \end{cases}$$

Now, we have $\Phi_j = u_j^\varepsilon = v = 0$ on ∂U . Also, thanks to assumption (H5.2), for $\mu > 0$ large enough

$$\begin{cases} v + H_1(x, Dv) + \gamma^\varepsilon(v - v - \psi_1) - \varepsilon \Delta v \geq 0 & \text{in } U, \\ v + H_2(x, Dv) + \gamma^\varepsilon(v - v - \psi_2) - \varepsilon \Delta v \geq 0 & \text{in } U, \end{cases}$$

that is, the pair (v, v) is a super-solution for the system (5.3). Thus, the comparison principle gives us that $\Phi_j \leq u_j^\varepsilon \leq v_j$ in U_δ . Then, from the fact that $\Phi_j = u_j^\varepsilon = v = 0$ on ∂U we get

$$\frac{\partial v}{\partial \nu}(x) \leq \frac{\partial u_j^\varepsilon}{\partial \nu}(x) \leq \frac{\partial \Phi_j}{\partial \nu}(x), \quad \text{for } x \in \partial U.$$

Hence, we obtain $\|Du_j^\varepsilon\|_{L^\infty(\partial U)} \leq C$, $j = 1, 2$.

Step II: Bound on U .

Assume now that there exists $\widehat{x} \in U$ such that

$$\max_{\substack{j=1,2 \\ x \in \overline{U}}} w_j^\varepsilon(x) = w_1^\varepsilon(\widehat{x}), \quad \text{where } w_j^\varepsilon(x) := \frac{1}{2} |Du_j^\varepsilon|^2, \quad j = 1, 2.$$

By a direct computation one can see that

$$2(1 + (\gamma^\varepsilon)' |_{\theta_1^\varepsilon}) w_1^\varepsilon + D_p H_1 \cdot Dw_1^\varepsilon + D_x H_1 \cdot Du_1^\varepsilon - (\gamma^\varepsilon)' |_{\theta_1^\varepsilon} Du_1^\varepsilon \cdot (D\psi_1 + Du_2^\varepsilon) = \varepsilon \Delta w_1^\varepsilon - \varepsilon |D^2 u_1^\varepsilon|^2.$$

Multiplying last relation by $\sigma^{1,\varepsilon}$ and integrating over U

$$\begin{aligned} & 2 \int_U w_1^\varepsilon \sigma^{1,\varepsilon} dx + \int_U D_p H_1 \cdot Dw_1^\varepsilon \sigma^{1,\varepsilon} dx - \varepsilon \int_U \Delta w_1^\varepsilon \sigma^{1,\varepsilon} dx + \int_U \varepsilon |D^2 u_1^\varepsilon|^2 \sigma^{1,\varepsilon} dx \\ & + \int_U D_x H_1 \cdot Du_1^\varepsilon \sigma^{1,\varepsilon} dx + \frac{1}{2} \int_U (\gamma^\varepsilon)' |_{\theta_1^\varepsilon} [|Du_1^\varepsilon|^2 + |Du_1^\varepsilon - Du_2^\varepsilon|^2 - |Du_2^\varepsilon|^2] \sigma^{1,\varepsilon} dx \\ & - \int_U (\gamma^\varepsilon)' |_{\theta_1^\varepsilon} Du_1^\varepsilon \cdot D\psi_1 \sigma^{1,\varepsilon} dx = 0. \end{aligned} \quad (5.9)$$

Then, using equation (5.5)₁ with $i = 1$ and $x_0 = \widehat{x}$

$$\begin{aligned} & \int_U w_1^\varepsilon \sigma^{1,\varepsilon} dx + \int_U \varepsilon |D^2 u_1^\varepsilon|^2 \sigma^{1,\varepsilon} dx - \int_U (\gamma^\varepsilon)' |_{\theta_1^\varepsilon} Du_1^\varepsilon \cdot D\psi_1 \sigma^{1,\varepsilon} dx \\ & + \int_U D_x H_1 \cdot Du_1^\varepsilon \sigma^{1,\varepsilon} dx + \frac{1}{2} \int_U (\gamma^\varepsilon)' |_{\theta_1^\varepsilon} [|Du_1^\varepsilon - Du_2^\varepsilon|^2 - |Du_2^\varepsilon|^2] \sigma^{1,\varepsilon} dx \\ & w_1^\varepsilon(\widehat{x}) + \varepsilon \int_{\partial U} \frac{\partial \sigma^{1,\varepsilon}}{\partial \nu} w_1^\varepsilon dS + \int_U (\gamma^\varepsilon)' |_{\theta_2^\varepsilon} w_1^\varepsilon \sigma^{2,\varepsilon} dx = 0, \end{aligned} \quad (5.10)$$

which implies

$$\begin{aligned} & w_1^\varepsilon(\widehat{x}) - \int_U (\gamma^\varepsilon)' |_{\theta_1^\varepsilon} w_2^\varepsilon \sigma^{1,\varepsilon} dx + \int_U (\gamma^\varepsilon)' |_{\theta_2^\varepsilon} w_1^\varepsilon \sigma^{2,\varepsilon} dx \\ & \leq \int_U (\gamma^\varepsilon)' |_{\theta_1^\varepsilon} Du_1^\varepsilon \cdot D\psi_1 \sigma^{1,\varepsilon} dx - \int_U D_x H_1 \cdot Du_1^\varepsilon \sigma^{1,\varepsilon} dx - \varepsilon \int_{\partial U} \frac{\partial \sigma^{1,\varepsilon}}{\partial \nu} w_1^\varepsilon dS. \end{aligned}$$

Let now $\eta > 0$ be a constant to be chosen later. Using Step I and Lemmas 5.3 and 5.5, thanks to Young's inequality

$$\begin{aligned} & w_1^\varepsilon(\widehat{x}) - \int_U (\gamma^\varepsilon)' |_{\theta_1^\varepsilon} w_2^\varepsilon \sigma^{1,\varepsilon} dx + \int_U (\gamma^\varepsilon)' |_{\theta_2^\varepsilon} w_1^\varepsilon \sigma^{2,\varepsilon} dx \\ & \leq \int_U (\gamma^\varepsilon)' |_{\theta_1^\varepsilon} \left[\eta^2 w_1^\varepsilon(\widehat{x}) + \frac{\|D\psi_1\|_{L^\infty}^2}{2\eta^2} \right] \sigma^{1,\varepsilon} dx \\ & \quad + \int_U \left[\eta^2 w_1^\varepsilon(\widehat{x}) + \frac{\|D_x H_1\|_{L^\infty}^2}{2\eta^2} \right] \sigma^{1,\varepsilon} dx + C \\ & \leq \eta^2 (C + 1) w_1^\varepsilon(\widehat{x}) + C \left(1 + \frac{1}{\eta^2} \right). \end{aligned} \quad (5.11)$$

In the same way, considering the analogous of equation (5.9) for the function w_2^ε (recalling that in (5.5) we chose $i = 1$) we can obtain the following inequality :

$$- \int_U (\gamma^\varepsilon)' |_{\theta_2^\varepsilon} w_1^\varepsilon \sigma^{2,\varepsilon} dx + \int_U (\gamma^\varepsilon)' |_{\theta_1^\varepsilon} w_2^\varepsilon \sigma^{1,\varepsilon} dx \leq \eta^2 (C + 1) w_1^\varepsilon(\widehat{x}) + C \left(1 + \frac{1}{\eta^2} \right), \quad (5.12)$$

where we also used the fact that $\|w_2^\varepsilon\|_{L^\infty} \leq w_1^\varepsilon(\hat{x})$. Summing inequalities (5.11) and (5.12) and choosing $\eta > 0$ small enough the conclusion follows. \square

Next lemma gives a control of the Hessians $D^2u_1^\varepsilon$ and $D^2u_2^\varepsilon$ in the support of $\sigma^{1,\varepsilon}$ and $\sigma^{2,\varepsilon}$ respectively.

Lemma 5.7. *There exists a positive constant C , independent of ε , such that*

$$\sup_{j=1,2} \int_U \varepsilon |D^2u_j^\varepsilon|^2 \sigma^{j,\varepsilon} dx \leq C.$$

Proof. The bound of the Hessian of $D^2u_1^\varepsilon$ comes from identity (5.10), together with Lemma 5.6. The other bound can be obtained in an similar way. \square

We can finally prove the analogous of Lemma 2.2.

Lemma 5.8. *There exists a positive constant, independent of ε , such that*

$$\max_{\substack{j=1,2 \\ x \in \overline{U}}} \frac{\theta_j^\varepsilon(x)}{\varepsilon} \leq C, \quad \max_{\substack{j=1,2 \\ x \in \overline{U}}} \gamma^\varepsilon(\theta_j^\varepsilon(x)) \leq C.$$

Proof. It will be enough to prove the second inequality, since the first one will follow by the definition of γ^ε . If the maximum is attained at the boundary, then

$$\max_{\substack{j=1,2 \\ x \in \overline{U}}} \gamma^\varepsilon(\theta_j^\varepsilon(x)) = \max_{\substack{j=1,2 \\ x \in \partial U}} \gamma^\varepsilon(-\psi_j(x)) = 0.$$

Otherwise, let us assume that there exists $x_1 \in U$ such that

$$\max_{j=1,2} \max_{x \in \overline{U}} \gamma^\varepsilon(\theta_j^\varepsilon) = \gamma^\varepsilon(\theta_1^\varepsilon)(x_1) > 0, \quad \gamma^\varepsilon(\theta_2^\varepsilon(x_1)) = 0.$$

Since γ^ε is increasing and $\gamma^\varepsilon(z) > 0$ if and only if $z > 0$, we also have $\max_{x \in \overline{U}} (\theta_1^\varepsilon(x)) = \theta_1^\varepsilon(x_1) > 0$.

Evaluating the two equations in (5.3) at x_1 and subtracting the second one from the first one

$$\begin{aligned} \theta_1^\varepsilon(x_1) + \gamma^\varepsilon(\theta_1^\varepsilon(x_1)) &= \varepsilon \Delta u_1^\varepsilon(x_1) - \varepsilon \Delta u_2^\varepsilon(x_1) - H_1(x_1, Du_1^\varepsilon(x_1)) + H_2(x_1, Du_2^\varepsilon(x_1)) - \psi_1(x_1) \\ &\leq \varepsilon \Delta \psi_1(x_1) - H_1(x_1, Du_1^\varepsilon(x_1)) + H_2(x_1, Du_2^\varepsilon(x_1)) - \psi_1(x_1) \\ &\leq \|\Delta \psi_1(\cdot)\|_{L^\infty} + \|H_1(\cdot, Du_1^\varepsilon(\cdot))\|_{L^\infty} + \|H_2(\cdot, Du_2^\varepsilon(\cdot))\|_{L^\infty} + \|\psi_1(\cdot)\|_{L^\infty} \leq C, \end{aligned}$$

where we the last inequality follows from Lemma 5.6. \square

We now set for every $\varepsilon \in (0, 1)$

$$u_{j,\varepsilon}^\varepsilon(x) := \frac{\partial u_j^\varepsilon}{\partial \varepsilon}(x), \quad x \in \overline{U}, j = 1, 2.$$

The next lemma gives a uniform bound for $u_{1,\varepsilon}^\varepsilon$ and $u_{2,\varepsilon}^\varepsilon$, thus concluding the proof of Theorem 5.1.

Lemma 5.9. *There exists a positive constant $C > 0$ such that*

$$\max_{\substack{j=1,2 \\ x \in \bar{U}}} |u_{j,\varepsilon}^\varepsilon(x)| \leq \frac{C}{\varepsilon^{1/2}}.$$

Proof. If the above maximum is attained at the boundary, then

$$\max_{\substack{j=1,2 \\ x \in \bar{U}}} |u_{j,\varepsilon}^\varepsilon(x)| = \max_{\substack{j=1,2 \\ x \in \partial U}} |u_{j,\varepsilon}^\varepsilon(x)| = 0,$$

since $u_{1,\varepsilon}^\varepsilon = u_{2,\varepsilon}^\varepsilon = 0$ on ∂U . Otherwise, assume that there exists $\bar{x} \in U$ such that

$$\max_{\substack{j=1,2 \\ x \in \bar{U}}} |u_{j,\varepsilon}^\varepsilon(x)| = |u_{1,\varepsilon}^\varepsilon(\bar{x})|.$$

Differentiating (5.3) w.r.t. ε we have

$$\begin{cases} (1 + (\gamma^\varepsilon)' |_{\theta_1^\varepsilon}) u_{1,\varepsilon}^\varepsilon + D_p H_1 \cdot D u_{1,\varepsilon}^\varepsilon - (\gamma^\varepsilon)' |_{\theta_1^\varepsilon} u_{2,\varepsilon}^\varepsilon + \gamma_\varepsilon^\varepsilon |_{\theta_1^\varepsilon} = \varepsilon \Delta u_{1,\varepsilon}^\varepsilon + \Delta u_1^\varepsilon & \text{in } U, \\ (1 + (\gamma^\varepsilon)' |_{\theta_2^\varepsilon}) u_{2,\varepsilon}^\varepsilon + D_p H_2 \cdot D u_{2,\varepsilon}^\varepsilon - (\gamma^\varepsilon)' |_{\theta_2^\varepsilon} u_{1,\varepsilon}^\varepsilon + \gamma_\varepsilon^\varepsilon |_{\theta_2^\varepsilon} = \varepsilon \Delta u_{2,\varepsilon}^\varepsilon + \Delta u_2^\varepsilon & \text{in } U. \end{cases} \quad (5.13)$$

Let $\sigma^{1,\varepsilon}$ and $\sigma^{2,\varepsilon}$ be the solutions to system (5.4) with $i = 1$ and $x_0 = \bar{x}$. Multiplying (5.13)₁ and (5.13)₂ by $\sigma^{1,\varepsilon}$ and $\sigma^{2,\varepsilon}$ respectively, integrating by parts and adding up the two relations obtained we have

$$u_{1,\varepsilon}^\varepsilon(\bar{x}) = \sum_{j=1}^2 \left(\int_U \Delta u_j^\varepsilon \sigma^{j,\varepsilon} dx - \int_U \gamma_\varepsilon^\varepsilon |_{\theta_j^\varepsilon} \sigma^{j,\varepsilon} dx \right).$$

Thus,

$$|u_{1,\varepsilon}^\varepsilon(\bar{x})| \leq \sum_{j=1}^2 \left(\int_U |\Delta u_j^\varepsilon| \sigma^{j,\varepsilon} dx + \int_U |\gamma_\varepsilon^\varepsilon |_{\theta_j^\varepsilon}| \sigma^{j,\varepsilon} dx \right).$$

At this point, the proof can be easily concluded by repeating what was done in Section 2 showing relations (2.12)–(2.15). \square
