FABER-KRAHN INEQUALITIES IN SHARP QUANTITATIVE FORM

LORENZO BRASCO, GUIDO DE PHILIPPIS, AND BOZHIDAR VELICHKOV

ABSTRACT. The classical Faber-Krahn inequality asserts that balls (uniquely) minimize the first eigenvalue of the Dirichlet-Laplacian among sets with given volume. In this paper we prove a sharp quantitative enhancement of this result, thus confirming a conjecture by Nadirashvili and Bhattacharya-Weitsman. More generally, the result applies to every optimal Poincaré-Sobolev constant for the embeddings \( W^{1,2}_0(\Omega) \hookrightarrow L^q(\Omega) \).

1. Introduction

1.1. Background. Let \( \Omega \subset \mathbb{R}^N \) be an open set with finite measure, we denote by \( W^{1,2}_0(\Omega) \) the closure of \( C_0^\infty(\Omega) \) in the norm

\[
\|u\|_{W^{1,2}_0(\Omega)} := \left( \int_\Omega |\nabla u|^2 \, dx \right)^{1/2}.
\]

The first eigenvalue of the Dirichlet-Laplacian of \( \Omega \) is defined by

\[
\lambda(\Omega) = \min_{u \in W^{1,2}_0(\Omega)} \left\{ \int_\Omega |\nabla u|^2 \, dx : \|u\|_{L^2(\Omega)} = 1 \right\}.
\]

The quantity \( \lambda(\Omega) \) is also called principal frequency of the set \( \Omega \). If we denote by \( \Delta \) the usual Laplace operator, \( \lambda(\Omega) \) coincides with the smallest real number \( \lambda \) for which the Helmholtz equation

\[-\Delta u = \lambda u \quad \text{in} \quad \Omega, \quad u = 0 \quad \text{on} \quad \partial \Omega,\]

admits non-trivial solutions.

A classical optimization problem connected with \( \lambda \) is the following one: among sets with given volume, find the one which minimizes the principal frequency \( \lambda \). Actually, balls are the (only) solutions to this problem, up to sets of zero capacity. As \( \lambda \) has the dimensions of a length to the power \(-2\), this “isoperimetric” property can be equivalently rewritten as

\[
|\Omega|^{2/N} \lambda(\Omega) \geq |B|^{2/N} \lambda(B),
\]

where \( B \) denotes a generic \( N \)-dimensional ball and \( |\cdot| \) stands for the \( N \)-dimensional Lebesgue measure of a set. Moreover, equality holds in (1.1) if and only if \( \Omega \) is a ball, up to a set of zero capacity. The estimate (1.1) is the celebrated Faber-Krahn inequality. We recall that the usual proof of this inequality relies on the so-called Schwarz symmetrization (see [24, Chapter 2]). The latter consists in associating to each positive function \( u \in W^{1,2}_0(\Omega) \) a radially symmetric decreasing function \( u^* \in W^{1,2}_0(\Omega) \) where \( B_\Omega \) is the ball centered at the origin such that \( |B_\Omega| = |\Omega| \). The function \( u^* \) is equimeasurable with \( u \), that is

\[
|\{ x : u(x) > t \}| = |\{ x : u^*(x) > t \}|, \quad \text{for every } t \geq 0,
\]

so that in particular every \( L^q \) norm of the function \( u \) is preserved. More interestingly, one has the well-known Pólya-Szegő principle

\[
\int_{B_\Omega} |\nabla u^*|^2 \, dx \leq \int_\Omega |\nabla u|^2 \, dx,
\]

Key words and phrases. Stability for eigenvalues, regularity for free boundaries, torsional rigidity.
from which the Faber-Krahn inequality easily follows.

The fact that balls can be characterized as the only sets for which equality holds in (1.1), naturally leads to consider the question of its stability. More precisely, one would like to improve (1.1), by adding in its right-hand side a remainder term measuring the deviation of a set $\Omega$ from spherical symmetry. A typical quantitative Faber-Krahn inequality then reads as follows

\[(1.3) \quad |\Omega|^{2/N} \lambda(\Omega) - |B|^{2/N} \lambda(B) \geq g(d(\Omega)),\]

where $g$ is a modulus of continuity and $\Omega \mapsto d(\Omega)$ is some scaling invariant asymmetry functional. The quest for quantitative versions like (1.3) is not new and has attracted an increasing interest in the last years. To the best of our knowledge, the first ones to prove partial results in this direction have been Hansen and Nadirashvili in [23] and Melas in [30]. Both papers treat the case of simply connected sets in dimension $N = 2$ or the case of convex sets in general dimensions. These pioneering results prove inequalities like (1.3), with a modulus of continuity (typically a power function) depending on the dimension $N$ and with the following asymmetry functionals\(^1\)

\[d_1(\Omega) = 1 - \frac{r_\Omega}{r_{B_\Omega}}, \quad \text{where} \quad r_\Omega = \text{inradius of } \Omega, \quad r_{B_\Omega} = \text{radius of the ball } B_\Omega,\]

like in [23], or

\[d_2(\Omega) = \min \left\{ \frac{\max\{|\Omega \setminus B_1|, |B_2 \setminus \Omega|\}}{|\Omega|} : B_1 \subset \Omega \subset B_2 \text{ balls} \right\},\]

as in [30]. It is easy to see that for general sets an estimate like (1.3) with the previous asymmetry functionals can not be true (just think of a ball with a small hole at the center). In the general case, a better notion of asymmetry is the so called Fraenkel asymmetry, defined as

\[(1.4) \quad A(\Omega) = \inf \left\{ \frac{|\Omega \Delta B|}{|B|} : B \text{ ball such that } |B| = |\Omega| \right\},\]

where the symbol $\Delta$ now stands for the symmetric difference between sets. For such an asymmetry functional, Bhattacharya and Weitsman [7] and Nadirashvili [32] independently conjectured the following.

**Conjecture.** There exists a dimensional constant $\sigma > 0$ such that

\[(1.5) \quad |\Omega|^{2/N} \lambda(\Omega) - |B|^{2/N} \lambda(B) \geq \sigma A(\Omega)^2.\]

In this paper we provide a positive answer to the above conjecture.

Let us notice that the previous result is sharp, since the power 2 on the asymmetry cannot be replaced by any smaller power. Indeed one can verify that the family of ellipsoids

\[\Omega_\varepsilon = \left\{ (x', x_N) \in \mathbb{R}^N : |x'|^2 + (1 + \varepsilon) x_N^2 \leq 1 \right\}, \quad 0 < \varepsilon \ll 1,\]

are such that

\[A(\Omega_\varepsilon) \simeq \varepsilon \quad \text{and} \quad |\Omega_\varepsilon|^{2/N} \lambda(\Omega_\varepsilon) - |B|^{2/N} \lambda(B) \simeq \varepsilon^2.\]

We mention that the following weaker version of (1.5) was already known,

\[|\Omega|^{2/N} \lambda(\Omega) - |B|^{2/N} \lambda(B) \geq \sigma \begin{cases} A(\Omega)^3, & N = 2, \\ A(\Omega)^4, & N \geq 3, \end{cases}\]

obtained by Bhattacharya [6] (for the case $N = 2$) and more recently by Fusco, Maggi and Pratelli in [21] for the general case. For ease of completeness, we also mention [34] and [36] for similar partial results and some probabilistic applications.

\(^1\)In the paper [30], the quantitative result is stated in a slightly different form, but it is not difficult to see that it can be written as in (1.3), by using the functional $d_2(\Omega)$. 
1.2. The result of this paper. Actually, we are going to prove a slightly more general version of (1.5). To state our result, let us consider the following optimal Poincaré-Sobolev constants for the embedding $W^{1/2}_0(\Omega) \hookrightarrow L^q(\Omega)$

$$\lambda_{2,q}(\Omega) = \min_{u \in W^{1/2}_0(\Omega)} \left\{ \int_\Omega |\nabla u|^2 \, dx : \|u\|_{L^q(\Omega)} = 1 \right\},$$

where the exponent $q$ satisfies

$$1 \leq q < 2^* := \begin{cases} \frac{2N}{N-2}, & \text{if } N \geq 3, \\ +\infty, & \text{if } N = 2. \end{cases}$$

Of course, when $q = 2$ we are back to the principal frequency mentioned at the beginning. We also point out that for $q = 1$, the quantity $1/\lambda_{2,1}(\Omega)$ is usually referred to as the torsional rigidity of the set $\Omega$. Observe that the shape functional $\Omega \mapsto \lambda_{2,q}(\Omega)$ verifies the scaling law

$$\lambda_{2,q}(t \Omega) = t^{N-2-\frac{2}{q}N} \lambda_{2,q}(\Omega),$$

the exponent $N - 2 - 2/q N$ being negative. In particular, the quantity

$$|\Omega|^\frac{2}{N-2} - \lambda_{2,q}(\Omega),$$

is scaling invariant. Still by means of Schwarz symmetrization, the following general family of Faber-Krahn inequalities can be derived

$$|\Omega|^\frac{2}{N-2} - \lambda_{2,q}(\Omega) \geq |B|^\frac{2}{N-2} - \lambda_{2,q}(B),$$

where $B$ is any $N$-dimensional ball. Again, equality in (1.8) is possible if and only if $\Omega$ is a ball, up to a set of zero capacity. The main result of the paper is the following sharp quantitative improvement of (1.8).

**Main Theorem.** Let $q$ be an exponent verifying (1.7). There exists a constant $\sigma_{2,q}$, depending only on the dimension $N$ and $q$, such that for every open set $\Omega \subset \mathbb{R}^N$ with finite measure we have

$$|\Omega|^\frac{2}{N-2} - \lambda_{2,q}(\Omega) - |B|^\frac{2}{N-2} - \lambda_{2,q}(B) \geq \sigma_{2,q} A(\Omega)^2.$$

As already mentioned, by choosing $q = 2$ we obtain a proof of the Bhattacharya-Weitsman and Nadirashvili Conjecture.

We also remark that, as explained in [11, Remark 3.6], the above Theorem allows to improve the exponent in the quantitative stability inequality for the second eigenvalue of the Dirichlet-Laplacian proved in [11, Theorem 3.5].

1.3. Strategy of the proof. We start recalling the usual strategy used to derive quantitative versions of Faber-Krahn inequalities. As the proof of (1.8) is based on the Pólya-Szego principle (1.2), the central core of all the already existing stability results is represented by Talenti’s proof of (1.2) (see [38]). This combines the Coarea Formula, the convexity of the function $t \mapsto t^2$ and the standard Isoperimetric Inequality

$$|\Omega|^{\frac{1}{N}} P(\Omega) \geq |B|^{\frac{1}{N}} P(B),$$

applied to the superlevel sets of a function $u$ achieving $\lambda_{2,q}(\Omega)$. Here $P(\cdot)$ denotes the perimeter of a set. The main idea of the papers [6, 21, 23] and [30] is that of substituting the classical isoperimetric statement (1.10) with an improved quantitative version. For simply connected sets in dimension $N = 2$ or for convex sets one can appeal to the so called Bonnesen inequalities (see [33]), like in [6, 23, 30]. More generally, one can apply the striking recent result of [20], proving a sharp quantitative version of (1.10) valid for every set and every dimension. Then the main difficulty is that of estimating the “propagation of asymmetry” from the superlevel sets of the
optimal function $u$ to the whole domain $\Omega$. This is a very delicate step, which usually results in a (non sharp) estimate like the ones recalled above. It is worth mentioning the paper [5] for some recent developments on quantitative versions of the Pólya-Szegő principle.

In this paper on the contrary, we use a different strategy. Indeed, the proof of our Main Theorem is based on the selection principle introduced by Cicalese and Leonardi in [15] to give a new proof of the previously recalled quantitative isoperimetric inequality of [20].

The selection principle turns out to be a very flexible technique and after the paper [15] it has been applied to a wide variety of geometric problems, see for instance [1, 8] and [17]. Up to now however it has been used only for problems where the main term is given, roughly speaking, by the perimeter of $\Omega$. As we will explain below, this is due to the fact that the selection principle highly relies on the regularity theory for sets minimizing some (perturbed) shape functional. If the dominating term of the functional is given by a area-type term, then well developed techniques in Geometric Measure Theory ensure the desired regularity.

Let us now explain the main ideas behind our proof. First by an application of the Kohler-Jobin inequality ([28]) we will show in Section 2 that (1.9) is implied by the following inequality

\begin{equation}
E(\Omega) - E(B_1) \geq \sigma A(\Omega)^2,
\end{equation}

where $\sigma$ is a dimensional constant and $B_1$ is the ball of radius 1 centered at the origin. Here $E(\Omega)$ is the energy functional of $\Omega$,

\begin{equation}
E(\Omega) = \min_{u \in W^{1,2}_0(\Omega)} \frac{1}{2} \int_{\Omega} |\nabla u|^2 \, dx - \int_{\Omega} u \, dx = \frac{1}{2} \int_{\Omega} |\nabla u|^2 \, dx - \int_{\Omega} u \, dx,
\end{equation}

where $u_\Omega \in W^{1,2}_0(\Omega)$ is the (unique) function achieving the above minimum.

Suppose now by contradiction that (1.11) is false. Since it is pretty easy to see that (1.11) can only fail in the small asymmetry regime (i.e. on sets converging in $L^1$ to the ball), we find a sequence of sets $\Omega_j$ such that

\begin{equation}
|\Omega_j| = |B_1|, \quad \varepsilon_j := A(\Omega_j) \to 0 \quad \text{and} \quad E(\Omega_j) - E(B_1) \leq \sigma A(\Omega_j)^2,
\end{equation}

with $\sigma$ as small as we wish. We now look for an “improved” sequence of sets $U_j$, still contradicting (1.11) and enjoying some additional smoothness properties. In the spirit of Ekeland’s variational principle, these sets will be selected through some minimization problem. Roughly speaking we look for sets $U_j$ which solve the following

\begin{equation}
\min \left\{ E(\Omega) + \sqrt{\varepsilon_j^2 + \sigma A(\Omega) - \varepsilon_j^2} : |\Omega| = |B_1| \right\}.
\end{equation}

One can easily show that the sequence $U_j$ still contradicts (1.11) and that $A(U_j) \to 0$ (see Lemma 4.7). Relying on the minimality of $U_j$, one then would like to show that the $L^1$ convergence to $B_1$ can be improved to a smooth convergence. If this is the case, then the second order expansion of $E(\Omega)$ for smooth nearly spherical sets done in Section 3 shows that (1.13) cannot hold true if $\sigma$ is sufficiently small.

The key point is thus to prove (uniform) regularity estimates for sets solving (1.14). For this, first one would like to get rid of volume constraints applying some sort of Lagrange multiplier principle to show that $U_j$ minimizes

\begin{equation}
E(\Omega) + \sqrt{\varepsilon_j^2 + \sigma A(\Omega) - \varepsilon_j^2} + \Lambda |\Omega|.
\end{equation}

Then, taking advantage of the fact that we are considering a “min–min” problem, the previous is equivalent to require that $u_j := u_{U_j}$ minimizes

\begin{equation}
\frac{1}{2} \int_{\mathbb{R}^N} |\nabla v|^2 \, dx - \int_{\mathbb{R}^N} v \, dx + \Lambda |\{v > 0\}| + \sqrt{\varepsilon_j^2 + \sigma A(\{v > 0\}) - \varepsilon_j^2},
\end{equation}

where

\begin{equation}
E(\Omega) = \min_{u \in W^{1,2}_0(\Omega)} \frac{1}{2} \int_{\Omega} |\nabla u|^2 \, dx - \int_{\Omega} u \, dx = \frac{1}{2} \int_{\Omega} |\nabla u|^2 \, dx - \int_{\Omega} u \, dx,
\end{equation}

\begin{equation}
S(\Omega) = \min_{u \in W^{1,2}_0(\Omega)} \frac{1}{2} \int_{\Omega} |\nabla u|^2 \, dx - \int_{\Omega} u \, dx = \frac{1}{2} \int_{\Omega} |\nabla u|^2 \, dx - \int_{\Omega} u \, dx.
\end{equation}

In this paper on the contrary, we use a different strategy. Indeed, the proof of our Main Theorem is based on the selection principle introduced by Cicalese and Leonardi in [15] to give a new proof of the previously recalled quantitative isoperimetric inequality of [20].
among all functions with compact support. Since we are now facing a perturbed free boundary type problem, we aim to apply the techniques of Alt and Caffarelli [3] (see also [12, 13]) to show the regularity of \( \partial U_j = \partial \{ u_j > 0 \} \) and to obtain the smooth convergence of \( U_j \) to \( B_1 \).

Even if this will be the general strategy, several non-trivial modifications have to be done to the above sketched proof. First of all, although solutions to (1.16) enjoy some mild regularity properties, we cannot expect \( \partial \{ u_j > 0 \} \) to be smooth. Indeed, by formally computing the optimality condition \(^2\) of (1.16) and assuming that \( B_1 \) is the unique optimal ball for \( \{ u_j > 0 \} \) in (1.4), one gets that \( u_j \) should satisfy

\[
\left| \frac{\partial u_j}{\partial \nu} \right|^2 = \Lambda + \frac{\sigma(A(\{ u_j > 0 \}) - \varepsilon_j)}{\sqrt{\varepsilon_j^2 + \sigma(A(\{ u_j > 0 \}) - \varepsilon_j)^2}} (1_{\mathbb{R}^N \setminus B_1} - 1_{B_1}) \quad \text{on} \quad \partial \{ u_j > 0 \},
\]

where \( 1_A \) denotes the characteristic function of a set \( A \) and \( \nu \) is the outer normal vector. This means that the normal derivative of \( u_j \) is discontinuous at points where \( U_j = \{ u_j > 0 \} \) crosses \( \partial B_1 \).

Since classical elliptic regularity implies that if \( \partial U_j \) is \( C^{1,\gamma} \) then \( u_j \in C^{1,\gamma}(U_j) \), it is clear that the sets \( U_j \) can not enjoy too much smoothness properties.

To overcome this difficulty, inspired by [4], we replace the Fraenkel asymmetry with a new “distance” between a set \( \Omega \) and the set of balls, which behaves like a squared \( L^2 \) distance between the boundaries (see Definition 4.1). In particular it dominates the square of the Fraenkel asymmetry (see Lemma 4.2) and it is differentiable with respect to the variations needed to compute the optimality conditions (see Lemma 4.15).

A second technical difficulty is that no global Lagrange multiplier principle is available. Indeed, since the energy \( E \) is negative and

\[
E(t \Omega) = t^{N+2} E(\Omega) \quad \text{and} \quad |t \Omega| = t^N |\Omega|, \quad t > 0,
\]

by a simple scaling argument one sees that the infimum of (1.15) is identically \(-\infty\). Reducing to a priori bounded sets and following [2], we can however replace the term \( \Lambda |\Omega| \) with a term of the form \( f(|\Omega|) \), for a suitable strictly increasing function vanishing when \( |\Omega| = |B_1| \), see Lemma 4.5 below. At this point we are able to perform the strategy described above to obtain (1.11) for uniformly bounded sets \( \Omega \), with a constant \( \sigma \) depending on \( \text{diam}(\Omega) \).

In Section 5 we will finally show how to pass from bounded to general sets. For this last step, we will take advantage of the non-optimal quantitative stability inequality proved in [21].

2. First step: reduction to the energy functional

For every \( \Omega \subset \mathbb{R}^N \) open set with finite measure, the energy functional is defined as

\[
E(\Omega) = \min_{u \in W^{1,2}_0(\Omega)} \frac{1}{2} \int_{\Omega} |\nabla u|^2 \, dx - \int_{\Omega} u \, dx.
\]

The function \( u_\Omega \) achieving the above minimum is unique and will be called energy function of \( \Omega \).

It satisfies

\[
-\Delta u_\Omega = 1 \quad \text{in} \; \Omega, \quad u_\Omega = 0 \quad \text{on} \; \partial \Omega,
\]

in weak sense. Multiplying the above equation by \( u_\Omega \) and integrating by parts one sees that

\[
E(\Omega) = -\frac{1}{2} \int_{\Omega} |\nabla u_\Omega|^2 \, dx = -\frac{1}{2} \int_{\Omega} u_\Omega \, dx.
\]

That is differentiating the functional along perturbation of the form \( v_t = u_j \circ (\text{Id} + tV) \) where \( V \) is a smooth vector field, see Appendix A and Lemma 4.15 below.
By means of an easy homogeneity argument, we have

\[(2.4) \quad E(\Omega) = -\frac{1}{2} \max_{u \in W^{1,2}_0(\Omega)} \left\{ \left( \int_{\Omega} u \, dx \right)^2 : \| \nabla u \|_{L^2(\Omega)} = 1 \right\} = -\frac{1}{2} \frac{1}{\lambda_{2,1}(\Omega)}. \]

In other words \(E(\Omega)\) coincides with the opposite of the torsional rigidity of \(\Omega\) (up to the multiplicative factor 1/2). In particular we must pay attention to the fact that \(E(\Omega)\) is always a negative quantity. Then the Faber-Krahn inequality (1.8) for \(q = 1\) can now be rewritten

\[(2.5) \quad E(\Omega) |\Omega|^{-\frac{N+2}{N}} \geq E(B) |B|^{-\frac{N+2}{N}}, \]

where \(B\) is any ball and equality can hold if and only if \(\Omega\) itself is a ball, up to a set of zero capacity. Sometimes we will refer to this inequality as the Saint-Venant inequality.

The quantity \(\lambda_{2,q}\) defined in (1.6) and the energy functional are linked by the following “isoperimetric” inequality, due to Marie-Thérèse Kohler-Jobin ([27, Theorem 3] and [28, Théorème 1]), see also [9] for some recent generalizations of this inequality.

**Kohler-Jobin inequality.** Let \(q > 1\) be an exponent verifying (1.7). For every \(\Omega \subset \mathbb{R}^N\) open set with finite measure, we have

\[(2.6) \quad \lambda_{2,q}(\Omega) (-E(\Omega))^\vartheta \geq \lambda_{2,q}(B) (-E(B))^\vartheta, \quad \text{with } \vartheta(q, N) = \left( \frac{1}{q} - \frac{N - 2}{2N} \right) \frac{2N}{N + 2}, \]

where \(B\) is any ball. Equality holds in (2.6) if and only if \(\Omega\) itself is a ball.

The next result shows that quantitative estimates for the energy functional \(E\), automatically translate into estimates for the Faber-Krahn inequality.

**Proposition 2.1.** Let \(q > 1\) be an exponent verifying (1.7). Suppose that there exists a constant \(\sigma_E > 0\) such that

\[(2.7) \quad E(\Omega) |\Omega|^{-\frac{N+2}{N}} - E(B) |B|^{-\frac{N+2}{N}} \geq \sigma_E A(\Omega)^2, \]

for every open set \(\Omega \subset \mathbb{R}^N\) with finite measure. Then we also have

\[|\Omega|^{\frac{N}{N+2} + \frac{2}{q} - 1} \lambda_{2,q}(\Omega) - |B|^{\frac{N}{N+2} + \frac{2}{q} - 1} \lambda_{2,q}(B) \geq \sigma_{2,q} A(\Omega)^2, \]

for some constant \(\sigma_{2,q} > 0\) depending only on \(\sigma_E\) and \(q\).

**Proof.** Without loss of generality, let us suppose that \(|\Omega| = 1\) and let \(B\) be a ball having unit measure. By (2.6) one obtains

\[(2.8) \quad \frac{\lambda_{2,q}(\Omega)}{\lambda_{2,q}(B)} - 1 \geq \left( \frac{E(B)}{E(\Omega)} \right)^\vartheta - 1. \]

Since \(0 < \vartheta \leq 1\), by concavity we have

\[t^\vartheta - 1 \geq (2^\vartheta - 1) (t - 1), \quad t \in [1, 2]. \]

Thus from (2.8) we can easily infer that if \(-E(B) \leq -2 E(\Omega)\), then

\[\frac{\lambda_{2,q}(\Omega)}{\lambda_{2,q}(B)} - 1 \geq c_\vartheta \left( \frac{E(B)}{E(\Omega)} - 1 \right) \geq \frac{c_\vartheta \sigma_E}{-E(B)} A(\Omega)^2. \]

In the last inequality we also used that \(-E(\Omega) \leq -E(B)\) by (2.5). On the other hand, if \(-E(B) > -2 E(\Omega)\), still by (2.8)

\[\frac{\lambda_{2,q}(\Omega)}{\lambda_{2,q}(B)} - 1 \geq 2^\vartheta - 1 \geq \frac{2^\vartheta - 1}{4} A(\Omega)^2, \]

since \(A(\Omega) < 2\). \qed
Remark 2.2. It is well-known that for \( N \geq 3 \) we have
\[
\lim_{q \to 2^*} \lambda_{2,q}(\Omega) = \inf \left\{ \int_{\mathbb{R}^N} |\nabla u|^2 \, dx : u \in W^{1,2}_0(\Omega), \|u\|_{L^2(\mathbb{R}^N)} = 1 \right\}.
\]
The latter is the best constant in the Sobolev inequality, a quantity which does not depend on the set \( \Omega \). Clearly this implies that the constant \( \sigma_{2,q} \) in (1.9) must converge to 0 as \( q \) goes to 2*. A closer inspection of the proof of Proposition 2.1 shows that
\[
\sigma_{2,q} \simeq 2^{\theta(q,N)} - 1 \simeq (2^* - q), \quad \text{as } q \to 2^*.
\]
The conformal case \( N = 2 \) is a little bit different. In this case we have (see [35, Lemma 2.2])
\[
\lim_{q \to +\infty} \lambda_{2,q}(\Omega) = 0 \quad \text{and} \quad \lim_{q \to +\infty} q \lambda_{2,q}(\Omega) = 8 \pi e,
\]
for every set \( \Omega \). The asymptotic behaviour of the constant \( \sigma_{2,q} \) is then given by
\[
\sigma_{2,q} \simeq (2^{\theta(q,2)} - 1) \lambda_{2,q}(B) \simeq \frac{8 \pi e}{q^2}, \quad \text{as } q \to +\infty.
\]

3. Second step: sharp stability for nearly spherical sets

In this section we show the validity of a stronger form of (1.11) for sets smoothly close to the ball \( B_1 \) of unit radius and centered at the origin. We start with two definitions.

Definition 3.1. An open bounded set \( \Omega \subset \mathbb{R}^N \) is said nearly spherical of class \( C^{2,\gamma} \) parametrized by \( \varphi \), if there exists \( \varphi \in C^{2,\gamma}(\partial B_1) \) with \( \|\varphi\|_{L^\infty} \leq 1/2 \), such that \( \partial \Omega \) is represented by
\[
\partial \Omega = \left\{ x \in \mathbb{R}^N : x = (1 + \varphi(y)) y, \text{ for } y \in \partial B_1 \right\}.
\]

Definition 3.2. Given a function \( \varphi : \partial B_1 \to \mathbb{R} \) we define
\[
\|\varphi\|^2_{H^{1/2}(\partial B_1)} := \int_{\partial B_1} \varphi^2 \, d\mathcal{H}^{N-1} + \int_{B_1} |\nabla H(\varphi)|^2 \, dx,
\]
where \( H(\varphi) \) is the \( W^{1,2} \) harmonic extension of \( \varphi \), i.e.
\[
\Delta H(\varphi) = 0 \quad \text{in } B_1, \quad H(\varphi) = \varphi \quad \text{on } \partial B_1.
\]

It can be easily proved that the above norm is equivalent to the classical \( H^{1/2} \) norm and that \( H^{1/2}(\partial B_1) \) is a Hilbert space with this norm. Moreover, thanks to the following Poincaré-Wirtinger trace inequality (see for instance [10, Section 4])
\[
\int_{\partial B_1} \left| w - \frac{1}{\int_{\partial B_1} w} \right|^2 \, d\mathcal{H}^{N-1} \leq \int_{B_1} |\nabla w|^2 \, dx, \quad w \in W^{1,2}(B_1),
\]
we have
\[
\|\nabla H(\varphi)\|_{L^2(\partial B_1)} \leq \|\varphi\|_{H^{1/2}(\partial B_1)} \leq \sqrt{2} \|\nabla H(\varphi)\|_{L^2(\partial B_1)}, \quad \text{for every } \varphi \text{ s. t. } \int_{\partial B_1} \varphi = 0.
\]
The main result of this section is then the following, where we denote by
\[
(3.2) \quad x_\Omega = \frac{1}{\int_{\Omega} x \, dx},
\]
the barycenter of \( \Omega \).

Theorem 3.3. Let \( 0 < \gamma \leq 1 \). Then there exists \( \delta_1 = \delta_1(N, \gamma) \) such that if \( \Omega \) is a nearly spherical set of class \( C^{2,\gamma} \) parametrized by \( \varphi \) with
\[
\|\varphi\|_{C^{2,\gamma}} \leq \delta_1, \quad |\Omega| = |B_1| \quad \text{and} \quad x_\Omega = 0,
\]
then
\[
(3.3) \quad E(\Omega) - E(B_1) \geq \frac{1}{32 \pi^2} \|\varphi\|^2_{H^{1/2}(\partial B_1)}.
\]
The proof of the above Theorem is based on the following Lemma, which is due to Dambrine, see [16, Theorem 1]. For the sake of completeness we give a sketch of its proof in Appendix A at the end of the paper.

**Lemma 3.4.** Let $0 < \gamma \leq 1$, there exist a modulus of continuity $\omega$ and a constant $\delta_2 = \delta_2(N, \gamma)$, such that, for every $C^{2, \gamma}$ nearly spherical set $\Omega$ parametrized by $\varphi$ with $\|\varphi\|_{C^{2, \gamma}} \leq \delta_2$ and $|\Omega| = |B_1|$, we have

$$E(\Omega) \geq E(B_1) + \frac{1}{2} \partial^2 E(B_1)[\varphi, \varphi] - \omega(\|\varphi\|_{C^{2, \gamma}})^2 \|\varphi\|_{H^{1/2}(\partial B_1)}^2,$$

where, for every $\varphi \in H^{1/2}(\partial B_1)$ we set

$$\partial^2 E(B_1)[\varphi, \varphi] := \frac{1}{N^2} \left( \int_{B_1} |\nabla H(\varphi)|^2 \, dx - \int_{\partial B_1} \varphi^2 \, dH^{N-1} \right).$$

By using this result, we can now prove Theorem 3.3.

**Proof of Theorem 3.3.** By assumption

$$|B_1| = |\Omega| = \int_{\partial B_1} \frac{(1 + \varphi)^N}{N} \, dH^{N-1} \quad \text{and} \quad 0 = |\Omega| \, y = \int_{\partial B_1} y \frac{(1 + \varphi)^{N+1}}{N + 1} \, dH^{N-1}.$$

Thanks to the smallness assumption on $\varphi$ we get

$$\left| \int_{\partial B_1} \varphi \, dH^{N-1} \right| = \left| \sum_{h=2}^{N} \binom{N}{h} \int_{\partial B_1} \frac{\varphi^h}{N} \, dH^{N-1} \right| \leq C \| \varphi \|_{H^{1/2}(\partial B_1)},$$

and

$$\left| \int_{\partial B_1} y \varphi \, dH^{N-1} \right| \leq \sum_{h=2}^{N} \binom{N}{h} \int_{\partial B_1} \frac{\varphi^h}{N + 1} \, dH^{N-1} \leq C \| \varphi \|_{H^{1/2}(\partial B_1)},$$

where $C = C(N)$ is a dimensional constant. Thus we obtain that $\varphi$ belongs to $\mathcal{M}_{C\delta_1}$, where we define

$$\mathcal{M}_{\delta} := \left\{ \xi \in H^{1/2}(\partial B_1) : \left| \int_{\partial B_1} \xi \, dH^{N-1} \right| + \left| \int_{\partial B_1} y \xi \, dH^{N-1} \right| \leq \delta \| \xi \|_{H^{1/2}(\partial B_1)} \right\}.$$  

By Lemma 3.4, if $\delta_1 \leq \delta_2$ we can infer

$$E(\Omega) \geq E(B_1) + \frac{1}{2} \partial^2 E(B_1)[\varphi, \varphi] - \omega(\|\varphi\|_{C^{2, \gamma}})^2 \|\varphi\|_{H^{1/2}(\partial B_1)}^2,$$

We now claim the following: there exists $\hat{\delta} = \hat{\delta}(N) > 0$ such that if $\delta \leq \hat{\delta}$ then

$$\partial^2 E(B_1)[\xi, \xi] \geq \frac{1}{8N^2} \|\xi\|_{H^{1/2}(\partial B_1)}^2, \quad \text{for every} \ \xi \in \mathcal{M}_{\delta}.$$  

By choosing $\delta_1 \ll \min\{\hat{\delta}, \delta_2\}$ sufficiently small it is clear that (3.9) together with (3.8) concludes the proof of (3.3). We are thus left to prove (3.9), which will be done in the two steps below.

**Step 1:** Let $\mathcal{M}_0$ be

$$\mathcal{M}_0 = \left\{ \xi \in H^{1/2}(\partial B_1) : \int_{\partial B_1} \xi \, dH^{N-1} = \int_{\partial B_1} x_i \xi \, dH^{N-1} = 0, \ i = 1, \ldots, N \right\},$$

then

$$\partial^2 E(B_1)[\xi, \xi] \geq \frac{1}{4N^2} \|\xi\|_{H^{1/2}(\partial B_1)}^2, \quad \text{for every} \ \xi \in \mathcal{M}_0.$$
To see this, just notice that
\[
\min \left\{ \frac{\int_{B_1} |\nabla H(\xi)|^2 \, dx}{\int_{\partial B_1} \xi^2 \, d\mathcal{H}^{N-1}} : \xi \in \mathcal{M}_0 \setminus \{0\} \right\} = 2,
\]
in every dimension \(N \geq 2\). Indeed the above minimum is the Rayleigh quotient of a Stekloff eigenvalue problem on \(\partial B_1\) which has as associated eigenspace the homogeneous harmonic polynomials of degree 2, see [10, Section 4] and [31]. From this, the definition of \(\partial^2 E\) (3.5) and (3.1) we get
\[
\partial^2 E(B_1)[\xi, \xi] \geq \frac{1}{2N^2} \int_{B_1} |\nabla H(\xi)|^2 \, dx \geq \frac{1}{4N^2} \|\xi\|_{H^{1/2}(\partial B_1)}^2,
\]
for every \(\xi \in \mathcal{M}_0\), which is precisely (3.10).

- **Step 2:** For every \(\xi \in \mathcal{M}_\delta\) let us consider its \(L^2\) projection on \(\mathcal{M}_0^\perp\), given by
\[
\Pi(\xi) = a_0 Y_0 + \sum_{i=1}^N a_{1,i} Y_{1,i},
\]
where
\[
Y_0 = \sqrt{\frac{1}{N |B_1|}} \quad \text{and} \quad Y_{1,i}(x) = \sqrt{\frac{1}{|B_1|}} x_i, \quad x \in \partial B_1, \quad i = 1, \ldots, N.
\]
and
\[
a_0 = \int_{\partial B_1} \xi Y_0 \, d\mathcal{H}^{N-1} \quad \text{and} \quad a_{1,i} = \int_{\partial B_1} \xi Y_{1,i} \, d\mathcal{H}^{N-1}, \quad i = 1, \ldots, N.
\]

It is immediate to check that \(\xi - \Pi(\xi) \in \mathcal{M}_0\). Moreover by Green formula
\[
\|\xi - \Pi(\xi)\|_{H^{1/2}(\partial B_1)}^2 = \|\xi\|_{H^{1/2}(\partial B_1)}^2 - \|\Pi(\xi)\|_{H^{1/2}(\partial B_1)}^2,
\]
and, by the definition of \(\mathcal{M}_\delta\),
\[
\|\Pi(\xi)\|_{H^{1/2}(\partial B_1)}^2 = a_0^2 + 2 \sum_{i=1}^N a_{1,i}^2 \leq C \delta^2 \|\xi\|_{H^{1/2}(\partial B_1)}^2.
\]
By bilinearity and Step 1, we have
\[
\partial^2 E[\xi, \xi] = \partial^2 E[\xi - \Pi(\xi), \xi - \Pi(\xi)] + 2 \partial^2 E[\xi, \Pi(\xi)] - \partial^2 E[\Pi(\xi), \Pi(\xi)]
\geq \frac{1}{4N^2} \|\xi - \Pi(\xi)\|_{H^{1/2}(\partial B_1)}^2 - 2 \|\xi\|_{H^{1/2}(\partial B_1)} \|\Pi(\xi)\|_{H^{1/2}(\partial B_1)} - \|\Pi(\xi)\|_{H^{1/2}(\partial B_1)}^2
\]
where we have used the trivial estimate
\[
|\partial^2 E(B_1)[\xi_1, \xi_2]| \leq \|\xi_1\|_{H^{1/2}(\partial B_1)} \|\xi_2\|_{H^{1/2}(\partial B_1)}, \quad \text{for every } \xi_1, \xi_2 \in H^{1/2}(\partial B_1).
\]
Equation (3.13), together with (3.11) and (3.12), gives
\[
\partial^2 E[\xi, \xi] \geq \frac{1}{4N^2} \|\xi\|_{H^{1/2}(\partial B_1)}^2 - C \delta \|\xi\|_{H^{1/2}(\partial B_1)}^2,
\]
from which (3.9) follows, choosing \(\delta\) small enough.

4. **Third step: stability for bounded sets with small asymmetry**

Throughout the rest of the paper we will denote by \(B_R(x_0)\) the ball
\[
B_R(x_0) = \{ x \in \mathbb{R}^N : |x - x_0| < R \}.
\]
When \(x_0\) coincides with the origin, we will simply use the notation \(B_R\).
4.1. **Stability via a selection principle.** The aim of this section is to prove the validity of the quantitative Saint-Venant inequality for bounded sets with small asymmetry. For this, we need to replace the Fraenkel asymmetry $A(\Omega)$ with a smoother asymmetry functional, as explained in the Introduction.

**Definition 4.1.** Given a bounded set $\Omega \subset \mathbb{R}^N$, we define

$$\alpha(\Omega) = \int_{\Omega \Delta B(x_\Omega)} |1 - |x - x_\Omega|| \, dx,$$

where $x_\Omega$ is the barycenter of $\Omega$ introduced in (3.2). Notice that $\alpha(\Omega) = 0$ if and only if $\Omega$ is a ball of radius 1, moreover we can write

$$\alpha(\Omega) = \beta_N + \int_{\Omega} (|x - x_\Omega| - 1) \, dx,$$

where $\beta_N = \int_{B_1} (1 - |x|) \, dx$.

Below we summarize the main properties of $\alpha$.

**Lemma 4.2.** Let $R \geq 2$, then:

(i) there exists a constant $C_1 = C_1(N)$ such that for every $\Omega$

$$C_1 \alpha(\Omega) \geq |\Omega \Delta B_1(x_\Omega)|^2;$$

(ii) there exists a constant $C_2 = C_2(R)$ such that for every $\Omega_1, \Omega_2 \subset B_R$, we have

$$|\alpha(\Omega_1) - \alpha(\Omega_2)| \leq C_2 |\Omega_1 \Delta \Omega_2|;$$

(iii) there exists two constants $\delta_3 = \delta_3(N) > 0$ and $C_3 = C_3(N) > 0$ such that for every nearly spherical set $\Omega$ with $\|\varphi\|_{L^\infty} \leq \delta_3$, we have

$$\alpha(\Omega) \leq C_3 \|\varphi\|_{L^2(\partial B_1)}^2.$$

**Proof.** The proof of (i) can be obtained by a simple rearrangement argument, similar to that used in the proof of [10, Theorem 2.2]. First of all, we can suppose for simplicity that $x_\Omega = 0$, then

$$\alpha(\Omega) = \int_{\Omega \setminus B_1} (|x| - 1) \, dx + \int_{B_1 \setminus \Omega} (1 - |x|) \, dx.$$

We then introduce the annular regions

$$T_1 = \{x \in \mathbb{R}^N : 1 < |x| < R_1\} \quad \text{and} \quad T_2 = \{x \in \mathbb{R}^N : R_2 < |x| < 1\},$$

where the two radii $R_1$ and $R_2$ are such that $|T_1| = |\Omega \setminus B_1|$ and $|T_2| = |B_1 \setminus \Omega|$, i.e.

$$R_1 = \left(1 + \frac{|\Omega \setminus B_1|}{|B_1|}\right)^{\frac{1}{N}} \quad \text{and} \quad R_2 = \left(1 - \frac{|B_1 \setminus \Omega|}{|B_1|}\right)^{\frac{1}{N}}.$$

By using this and the fact that in (4.3) we are integrating two monotone functions of the modulus, we get

$$\alpha(\Omega) \geq \int_{T_1} (|x| - 1) \, dx + \int_{T_2} (1 - |x|) \, dx$$

$$= \omega_N \left[ \frac{R_1^{N+1} - 1}{N + 1} - \frac{R_1^N - 1}{N} + \frac{R_2^{N+1} - 1}{N + 1} - \frac{R_2^N - 1}{N} \right] \geq \frac{1}{C_1} |\Omega \Delta B_1|^2.$$
In order to prove (ii), we first notice that by using (4.2) and triangular inequality, we get

\[ |\alpha(\Omega_1) - \alpha(\Omega_2)| \leq \left| \int_{\Omega_1} |x - x_{\Omega_1}| \, dx - \int_{\Omega_2} |x - x_{\Omega_2}| \, dx \right| + |\Omega_1 \Delta \Omega_2| \]

\[ \leq \int_{\Omega_1 \cap \Omega_2} |x_{\Omega_1} - x_{\Omega_2}| \, dx + \int_{\Omega_1 \setminus \Omega_2} |x - x_{\Omega_1}| \, dx \]

\[ + \int_{\Omega_2 \setminus \Omega_1} |x - x_{\Omega_2}| \, dx + |\Omega_1 \Delta \Omega_2|. \]

Finally, by using that

\[ |\Omega_1 \cap \Omega_2| |x_{\Omega_1} - x_{\Omega_2}| \leq C(R) |\Omega_1 \Delta \Omega_2|, \]

and that \(|x - x_{\Omega}| \leq 2R\) for every \(x \in B_R\), we can conclude.

We then prove property (iii), for nearly spherical sets. By definition of \(\alpha(\Omega)\)

\[ \alpha(\Omega) = \int_{\Omega \setminus B_1} (|x| - 1) \, dx + \int_{B_1 \setminus \Omega} (1 - |x|) \, dx \]

\[ = \int_{\{\varphi \geq 0\}} \frac{(1 + \varphi(y))^{N+1} - 1}{N+1} \, dH^{N-1} - \int_{\{\varphi \geq 0\}} \frac{(1 + \varphi(y))^N - 1}{N} \, dH^{N-1} \]

\[ + \int_{\{\varphi < 0\}} \frac{(1 + \varphi(y))^{N+1} - 1}{N+1} \, dH^{N-1} - \int_{\{\varphi < 0\}} \frac{(1 + \varphi(y))^N - 1}{N} \, dH^{N-1}. \]

By observing that there exist a constant \(C = C(N) > 1\) such that

\[ \frac{(1 + t)^{N+1} - 1}{N+1} \leq t + C t^2, \quad |t| \leq \frac{1}{2} \]

and

\[ \frac{(1 + t)^N - 1}{N} \geq t + \frac{1}{C} t^2, \quad |t| \leq \frac{1}{2}, \]

we obtain the estimate. \(\square\)

This is the main result of this section.

**Theorem 4.3.** For every \(R \geq 2\), there exist two constants \(\bar{\sigma} = \bar{\sigma}(N,R) > 0\) and \(\bar{\varepsilon} = \bar{\varepsilon}(N,R) > 0\) such that

\[ (4.4) \quad E(\Omega) - E(B_1) \geq \bar{\sigma} \alpha(\Omega), \]

for all sets \(\Omega\) contained in \(B_R\) with \(|\Omega| = |B_1|\) and \(\alpha(\Omega) \leq \bar{\varepsilon} \).

In order to prove Theorem 4.3, we argue by contradiction. Up to rename \(\sigma\), we assume that there exists a sequence of sets \(\widetilde{\Omega}_j \subset B_R\) such that

\[ (4.5) \quad |\widetilde{\Omega}_j| = |B_1| \quad \text{and} \quad \varepsilon_j := \alpha(\widetilde{\Omega}_j) \to 0, \quad \text{while} \quad E(\widetilde{\Omega}_j) - E(B_1) \leq \sigma^4 \varepsilon_j, \]

where \(\sigma < 1\) is a suitably small parameter that will be chosen later\(^3\). The key ingredient is given by the following.

**Proposition 4.4** (Selection Principle). Let \(R \geq 2\) then there exists \(\bar{\sigma} = \bar{\sigma}(N,R) > 0\) such that if \(\sigma \leq \bar{\sigma}(N,R)\) and \(\widetilde{\Omega}_j\) are as in (4.5), then we can find a sequence of smooth open sets \(U_j \subset B_R\) satisfying:

(i) \(|U_j| = |B_1|\);
(ii) \(x_{U_j} = 0\);
(iii) \(\partial U_j\) are converging to \(\partial B_1\) in \(C^k\) for every \(k\);

\(^3\) We put \(\sigma^4\) just to simplify some of the computations below.
(iv) there holds

\[ \limsup_{j \to \infty} \frac{E(U_j) - E(B_1)}{\alpha(U_j)} \leq \tilde{C} \sigma, \]

for some constant \( \tilde{C} = \tilde{C}(N, R) \).

The proof of the Selection Principle is quite involved and will occupy the rest of the section. By combining this result and the stability estimate for nearly spherical sets, we can conclude the proof of Theorem 4.3.

**Proof of Theorem 4.3.** As above, arguing by contradiction we can exhibit a sequence of sets \( \{U_j\} \) smoothly converging to the ball \( B_1 \) and having the properties expressed by Proposition 4.4. In particular, for \( j \in \mathbb{N} \) large enough each \( U_j \) is a nearly spherical set of class \( C^2, \gamma \), satisfying the hypotheses of Theorem 3.3. The latter, Lemma 4.2 (iii) and Proposition 4.4 (iv) then give

\[ \frac{1}{32N^2C_3} \leq \limsup_{j \to \infty} \frac{E(U_j) - E(B_1)}{\alpha(U_j)} \leq \tilde{C} \sigma. \]

By choosing \( \sigma \) suitably small, we get the desired contradiction. \( \Box \)

4.2. **Proof of the Selection Principle: a penalized minimum problem.** In order to prove Proposition 4.4 above, we would like to use the local regularity theory for free boundary-type problems. As explained in the Introduction, we need to get rid of the volume constraint \( |\Omega| = |B_1| \).

To this end we introduce the following function (see [2])

\[ f_\eta(s) = \begin{cases} \eta(s - \omega N) & \text{if } s \leq \omega N, \\ (s - \omega N)/\eta & \text{if } s \geq \omega N. \end{cases} \]

Notice that the function \( f_\eta \) defined above satisfies the following Lipschitz-type property

\[ \eta(s_1 - s_2) \leq f_\eta(s_1) - f_\eta(s_2) \leq \frac{1}{\eta}(s_1 - s_2), \]

for every \( 0 \leq s_2 \leq s_1 \).

**Lemma 4.5.** For every \( R \geq 2 \) there exists a \( \tilde{\eta} = \tilde{\eta}(R) < 1 \) such that, up to translations, \( B_1 \) is a minimizer of

\[ F_{\tilde{\eta}}(\Omega) = E(\Omega) + f_{\tilde{\eta}}(|\Omega|), \]

among all sets contained in \( B_R \). Moreover, there exists a costant \( C_4 = C_4(N, R) > 0 \) such that for any other ball \( B_r \) with \( 0 \leq r \leq R \), there holds

\[ F_{\tilde{\eta}}(B_r) - F_{\tilde{\eta}}(B_1) \geq \frac{|r - 1|}{C_4}. \]

**Proof.** By using the Pólya-Szegö principle (1.2) it is easily seen that among minimizers of \( F_\eta \) there is a ball of radius \( r(\eta) \leq R \). Let us show that we can choose \( \eta \) such that \( r = 1 \). To this aim, we introduce

\[ g(r) = F_\eta(B_r) = r^{N+2} E(B_1) + f_\eta(\omega_N r^N). \]

Assume that \( 1 < r \leq R \), then

\[ g'(r) = r^{N-1} \left( (N+2) r^2 E(B_1) + \frac{N\omega_N}{\eta} \right) \geq r^{N-1} \left( -(N+2) R^2 |E(B_1)| + \frac{N\omega_N}{\eta} \right) > 0, \]

if \( \eta \) is small enough. For \( r \leq 1 \) we notice that we can easily choose \( \eta \ll 1 \) such that the function

\[ r \mapsto g(r), \quad 0 < r \leq 1, \]
admits a minimum in $r = 1$. Moreover it is easy to see that with the above choice of $\eta$ there exists a constant $C = C(N, R)$ such that

$$\lim_{r \to 1^-} g'(r) \leq -1/C \quad \text{and} \quad \lim_{r \to 1^+} g'(r) \geq 1/C,$$

from which (4.9) follows. \hfill \Box

Up to a translation and a (small) dilation the sets $U_j$ constructed in Proposition 4.4 are given by the family of minimizers of the following penalized problems

$$\min \left\{ \mathcal{G}_{\tilde{u},j}(\Omega) : \Omega \subset B_R \right\} \tag{4.10}$$

Here the functionals $\mathcal{G}_{\tilde{u},j}$ are given by

$$\mathcal{G}_{\tilde{u},j}(\Omega) = \mathcal{F}_{\tilde{u}}(\Omega) + \sqrt{\varepsilon_j^2 + \sigma^2(\alpha(\Omega) - \varepsilon_j)^2}.$$

Following a by now classical approach, in order to find a minimizer to (4.10), we need to extend the functionals $\mathcal{G}_{\tilde{u},j}$ to the class of quasi-open sets. Referring to [14, Chapter 4] for a complete account on the theory of these sets, we simply recall here the main facts needed in the sequel.

A Borel set $U$ is said quasi-open if there is a $W^{1,2}(\mathbb{R}^N)$ function $u$ such that

$$U = \left\{ x : \tilde{u}(x) > 0 \right\},$$

where $\tilde{u}$ is the precise representative of $u$, uniquely defined outside a set of zero capacity, see [18, Section 4.8]. Given a quasi-open set $U$ we can define

$$W^{1,2}_0(U) = \left\{ v \in W^{1,2}(\mathbb{R}^N) : \text{Capacity} \left( \left\{ v \neq 0 \right\} \cap (\mathbb{R}^N \setminus U) \right) = 0 \right\},$$

which is a strongly closed and convex subset of $W^{1,2}$ (hence also weakly closed). Then for a quasi-open set $U$ its energy is still defined as

$$E(U) = \inf_{v \in W^{1,2}_0(U)} \frac{1}{2} \int_U |\nabla u|^2 \, dx - \int_U v \, dx. \tag{4.11}$$

The function $u_U$ achieving the above infimum is still called the energy function of $U$. The following "minimum principle" is easily seen to hold true

$$U = \{ x : \tilde{u}_U(x) > 0 \}. \tag{4.12}$$

We are now ready to prove the following.

**Lemma 4.6.** There exists $\sigma_1 = \sigma_1(N, R) > 0$ such that if $\sigma \leq \sigma_1$ then the infimum (4.10) is attained by a quasi-open set $\Omega_j$. Moreover the perimeter of $\Omega_j$ is bounded independently on $j$.

**Proof.** Let $\{O_k\}_{k \in \mathbb{N}} \subset B_R$ be a minimizing sequence satisfying

$$\mathcal{G}_{\tilde{u},j}(O_k) \leq \mathcal{G}_{\tilde{u},j} + \frac{1}{k}, \quad k \in \mathbb{N}.$$

Denoting for simplicity with $u_k = \tilde{u}_{O_k}$ the precise representative of the energy function of $O_k$, (4.12) yields

$$O_k = \{ x : u_k(x) > 0 \}. \tag{4.13}$$

Let us set $t_k = 1/\sqrt{k}$, then we define

$$V_k = \{ x : u_k(x) > t_k \}.$$ 

Notice that the function $v_k = (u_k - t_k)_+$ is the energy function for $V_k$. By this and by

$$\mathcal{G}_{\tilde{u},j}(O_k) \leq \mathcal{G}_{\tilde{u},j}(V_k) + 1/k,$$
we infer
\[ \frac{1}{2} \int |\nabla u_k|^2 \, dx - \int u_k \, dx = \frac{1}{2} \int_{\{u_k > t_k\}} |\nabla u_k|^2 \, dx - \int_{\{u_k > t_k\}} (u_k - t_k) \, dx 
+ f_\hat{\eta}(|\{u_k > t_k\}|) + \sqrt{\varepsilon_j^2 + \sigma^2} (\alpha(\{u_k > t_k\}) - \varepsilon_j)^2 \]
\leq \frac{1}{2} \int_{\{u_k > t_k\}} |\nabla u_k|^2 \, dx - \int_{\{u_k > t_k\}} (u_k - t_k) \, dx 
+ f_\hat{\eta}(|\{u_k > t_k\}|) + \sqrt{\varepsilon_j^2 + \sigma^2} (\alpha(\{u_k > t_k\}) - \varepsilon_j)^2 + \frac{1}{k}.

Using (4.7), the Lipschitz character of the function \( t \mapsto \sqrt{\varepsilon_j^2 + \sigma^2} (t - \varepsilon_j)^2 \) and Lemma 4.2 (ii) we obtain
\[ \frac{1}{2} \int_{\{0 < u_k < t_k\}} |\nabla u_k|^2 \, dx + \hat{\eta} \{0 < u_k < t_k\} \leq t_k \{u_k > 0\} + \sigma |\alpha(\{u_k > 0\}) - \alpha(\{u_k > t_k\})| + \frac{1}{k} \]
\leq t_k \{u_k > 0\} + C_2 \sigma \{0 < u_k < t_k\} + \frac{1}{k}.

Choosing \( \sigma \) such that \( C_2 \sigma \leq \hat{\eta}/2 \) we obtain
\[ \frac{1}{2} \int_{\{0 < u_k < t_k\}} |\nabla u_k|^2 \, dx + \frac{\hat{\eta}}{2} \{0 < u_k < t_k\} \leq |B_R| t_k + \frac{1}{k}. \]
By the co-area formula and the Cauchy-Schwarz inequality, and recalling that \( \hat{\eta} < 1 \), we infer
\[ \hat{\eta} \int_{0}^{t_k} P(\{u_k > s\}) \, ds = \hat{\eta} \int_{\{0 < u_k < t_k\}} |\nabla u_k| \, dx \]
\leq \hat{\eta} \int_{\{0 < u_k < t_k\}} |\nabla u_k|^2 \, dx + \frac{\hat{\eta}}{2} \{0 < u_k < t_k\} \]
\leq |B_R| t_k + \frac{1}{k}.

Since \( t_k = 1/\sqrt{k} \), we can find a level \( 0 \leq s_k \leq 1/\sqrt{k} \) such that the sets
\[ W_k = \{ x : u_k(x) > s_k \}, \]
satisfy
\[ P(W_k) \leq \frac{2 \hat{\eta}}{\hat{\eta} t_k} \int_{0}^{t_k} P(\{u_k > s\}) \, ds \leq \frac{2 |B_R|}{\hat{\eta}} + \frac{2}{\hat{\eta} t_k k} = C(N, R) + \frac{2}{\hat{\eta} \sqrt{k}}. \]
We claim that \( W_k \) is still a minimizing sequence. Indeed, using (4.7) and Lemma 4.2 (ii), for \( \sigma \) such that \( C_2 \sigma \leq \hat{\eta}/2 \) we have
\[ \mathcal{G}_{\hat{\eta},j}(W_k) = \int_{\{u_k > s_k\}} |\nabla u_k|^2 \, dx - \int_{\{u_k > s_k\}} (u_k - s_k) \, dx 
+ f_\hat{\eta}(|\{u_k > s_k\}|) + \sqrt{\varepsilon_j^2 + \sigma^2} (\alpha(\{u_k > s_k\}) - \varepsilon_j)^2 \]
\leq \mathcal{G}_{\hat{\eta},j}(\mathcal{O}_k) + s_k \{u_k > 0\} + f_\hat{\eta}(|\{u_k > s_k\}|) - f_\hat{\eta}(|\{u_k > 0\}|) 
+ \sigma |\alpha(\{u_k > s_k\}) - \alpha(\{u_k > 0\})| \]
\leq \mathcal{G}_{\hat{\eta},j}(\mathcal{O}_k) + |B_R|/\sqrt{k} - (\hat{\eta} - C_2 \sigma) |\{0 < u_k < s_k\}| \leq \mathcal{G}_{\hat{\eta},j}(\mathcal{O}_k) + |B_R|/\sqrt{k},
where we used again that \((u_k - s_k)_+\) is the energy function of \( W_k \).

By compactness of sets with equi-bounded perimeter, (4.14) implies the existence of a Borel set \( W_\infty \) such that
\[ 1_{W_k} \to 1_{W_\infty} \quad \text{in} \quad L^1(B_R) \quad \text{and} \quad P(W_\infty) \leq C(N, R). \]
Proof. 4.6 satisfies the following properties:

Lemma 4.7
Proof of the Selection Principle: properties of the minimizers.

\[ C \]
Since \( |C| \) together with Lemma 4.2 (ii), (4.7) and \( B \) from which we obtain (4.16). Moreover, since \( \sigma < 1 \), which implies

\[ \frac{\alpha}{\alpha} = \frac{\alpha}{\alpha} \]

Setting \( w_k = (u_k - s_k)_+ \), it is immediate to see that this is an equi-bounded sequence in \( W^{1,2}_0(B_R) \), thus up to subsequences we can infer the existence of \( w \in W^{1,2}_0(B_R) \) such that

\[ \lim_{k \to \infty} \| w_k - w \|_{L^2} = 0. \]

If we set \( W = \{ x : \bar{w}(x) > 0 \} \), then

\[ 1_W(x) \leq \liminf_{k \to \infty} 1_{W_k}(x) = 1_{W_\infty}(x), \quad \text{for a.e. } x \in B_R, \]

which implies \( |W \setminus W_\infty| = 0 \). By the semicontinuity of the Dirichlet integral and the continuity of \( \alpha(\cdot) \) with respect to the \( L^1 \) convergence of sets, passing to the limit as \( k \) goes to \( \infty \) in (4.15), we get

\[ E(W) + f_\tilde{\eta}(|W_\infty|) + \sqrt{\varepsilon_j^2 + \sigma^2(\alpha(W_\infty) - \varepsilon_j)^2} \]

\[ \leq \frac{1}{2} \int |\nabla w|^2 \, dx - \int w \, dx + f_\tilde{\eta}(|W_\infty|) + \sqrt{\varepsilon_j^2 + \sigma^2(\alpha(W_\infty) - \varepsilon_j)^2} \]

\[ \leq \inf G_{\tilde{\eta},j} \leq E(W) + f_\tilde{\eta}(|W|) + \sqrt{\varepsilon_j^2 + \sigma^2(\alpha(W) - \varepsilon_j)^2}. \]

This in turn gives

\[ f_\tilde{\eta}(|W_\infty|) - f_\tilde{\eta}(|W|) \leq \sigma |\alpha(W) - \alpha(W_\infty)|, \]

which together with Lemma 4.2 (ii), (4.7) and \( |W \setminus W_\infty| = 0 \) yields

\[ \tilde{\eta}|W_\infty \setminus W| \leq C_2 \sigma |W_\infty \setminus W|. \]

Since \( C_2 \sigma \leq \tilde{\eta}/2 \), this implies that \( |W \Delta W_\infty| = 0 \), so that \( W \) is the desired minimizer \( \Omega_j \).

\[ \square \]

Lemma 4.7 (Properties of minimizers, Part I). The sequence of minimizers \( \{ \Omega_j \}_j \) found in Lemma 4.6 satisfies the following properties:

\begin{enumerate}
\item \( |\alpha(\Omega_j) - \varepsilon_j| \leq 3 \sigma \varepsilon_j \) and \( |\Omega_j| - |B_1| \leq C_5 \sigma^4 \varepsilon_j \), where \( C_5 = C_5(R, N) \);
\item up to translations \( \Omega_j \to B_1 \) in \( L^1 \);
\item the following inequality holds true
\end{enumerate}

\[ 0 \leq F_{\tilde{\eta}}(\Omega_j) - F_{\tilde{\eta}}(B_1) \leq \sigma^4 \varepsilon_j. \]

Proof. We start noticing that by the minimality property of \( \Omega_j \) and by the definition (4.5) of \( \tilde{\Omega}_j \)

\[ F_{\tilde{\eta}}(\Omega_j) + \varepsilon_j \leq F_{\tilde{\eta}}(\Omega_j) + \sqrt{\varepsilon_j^2 + \sigma^2(\alpha(\Omega_j) - \varepsilon_j)^2} \]

\[ = G_{\tilde{\eta},j}(\Omega_j) \leq G_{\tilde{\eta},j}(\tilde{\Omega}_j) = F_{\tilde{\eta}}(\tilde{\Omega}_j) + \varepsilon_j \leq F_{\tilde{\eta}}(B_1) + (1 + \sigma^4) \varepsilon_j, \]

from which we obtain (4.16). Moreover, since \( B_1 \) minimizes \( F_{\tilde{\eta}} \), from the previous we deduce that

\[ \sqrt{\varepsilon_j^2 + \sigma^2(\alpha(\Omega_j) - \varepsilon_j)^2} \leq \varepsilon_j (1 + \sigma^4), \]

which implies, since \( \sigma < 1 \),

\[ \varepsilon_j^2 + \sigma^2(\alpha(\Omega_j) - \varepsilon_j)^2 \leq \varepsilon_j^2 (1 + \sigma^4)^2 \leq \varepsilon_j^2 (1 + 3 \sigma^4). \]

From this we obtain the first part of point (i). To obtain the second we notice that if \( B_{\Omega_j} \) is a ball of the same measure as \( \Omega_j \), then by the Pólya-Szegö principle

\[ F_{\tilde{\eta}}(B_{\Omega_j}) \leq F_{\tilde{\eta}}(\Omega_j), \]

hence, by (4.16) and (4.9),

\[ \| \Omega_j |^{1/N} - |B_1 |^{1/N} \| \leq C_4 \omega_N^{1/N} \sigma^4 \varepsilon_j. \]
To prove point (ii) we notice that, up to translations, we can assume that \(x_\Omega = 0\). By Lemma 4.6 the sets \(\Omega_j\) have equi-bounded perimeter hence they are pre-compact in \(L^1(B_R)\). By the continuity of \(\alpha(\cdot)\), with respect to the \(L^1\) convergence, and point (i) we see that any limit set \(\Omega_\infty\) satisfies \(\alpha(\Omega_\infty) = 0\), from which point (ii) follows.

We now start studying the regularity of the sets \(\Omega_j\). In order to do this we recall that by (4.12) \(\Omega_j = \{u_j > 0\}\) where \(u_j = u_{\Omega_j}\) is the energy function of \(\Omega_j\). If \(v \in W^{1,2}_0(B_R)\), testing the minimality of \(\Omega_j\) with \(\{v > 0\}\) and recalling the definition of energy (4.11), we immediately see that \(u_j\) satisfies the following minimum property

\[
\frac{1}{2} \int |\nabla u_j|^2 \, dx - \int u_j \, dx + f_\tilde{\eta}(\{u_j > 0\}) + \sqrt{\epsilon_j^2 + \sigma^2(\alpha(\{u_j > 0\}) - \varepsilon_j)^2} \leq \frac{1}{2} \int |\nabla v|^2 \, dx - \int v \, dx + f_\tilde{\eta}(\{v > 0\}) + \sqrt{\epsilon_j^2 + \sigma^2(\alpha(\{v > 0\}) - \varepsilon_j)^2}.
\]

Using Lemma 4.2, we obtain that \(u_j\) behaves like a perturbed minimum of a free boundary-type problem, more precisely

\[
\frac{1}{2} \int |\nabla u_j|^2 \, dx - \int u_j \, dx + f_\tilde{\eta}(\{u_j > 0\}) \leq \frac{1}{2} \int |\nabla v|^2 \, dx - \int v \, dx + f_\tilde{\eta}(\{v > 0\}) + C_2 \sigma \, \{u_j > 0\} \Delta \{v > 0\},
\]

for all \(v \in W^{1,2}_0(B_R)\).

**Remark 4.8.** The above two equations are the starting point to study the regularity of \(\partial \Omega_j = \partial \{u_j > 0\}\) using the techniques of Alt and Caffarelli, [3]. We remark that (4.19) can be summarized by saying the \(u_j\) is a quasi-minimizer of the free boundary problem, in the spirit of perimeter quasi-minimizers, see [29, Part 3]. However in this kind of problems this notion can not provide too much regularity of \(\partial \{u_j > 0\}\), indeed in general the volume term appearing in the right-hand side of (4.19) is not lower order. To obtain our results we have to take advantage that the parameter \(\sigma\) multiplying such a term can be taken much smaller than \(\tilde{\eta}\).

After [3] it is by now well understood that the first step in order to prove regularity for solutions of (4.18) is to show that

\[u_j(x) \sim \text{dist}(x, \partial\{u_j > 0\}), \quad x \in \{u_j > 0\},\]

in some integral sense. This will be done in the next two Lemmas, which are the analogous of [3, Lemma 3.4] and [3, Lemma 3.2].

**Lemma 4.9.** Let \(u_j\) be as above. There exists \(\sigma_2 = \sigma_2(N, \kappa) > 0\) such that for every \(\kappa \in (0,1)\) one can find positive constants \(m, \varrho_0\) depending only on \(\kappa, \sigma, R\) and the dimension, such that, if \(\sigma \leq \sigma_2\), \(\varrho \leq \varrho_0\), \(x_0 \in B_R\) and

\[ \int_{\partial B_\varrho(x_0) \cap B_R} u_j \, d\mathcal{H}^{N-1} \leq m \varrho, \]

then \(u = 0\) in \(B_{\kappa \varrho_0}(x_0) \cap B_R\).

**Proof.** Being \(j\) fixed for notational simplicity we drop the subscript. Moreover, being \(x_0\) fixed we simply write \(B_\varrho\) for \(B_\varrho(x_0)\).

It is well known that \(u\) (extended to 0 outside \(B_R\)) satisfies \(-\Delta u \leq 1\) in the weak sense, hence the function

\[ u(x) + \frac{|x - x_0|^2 - \varrho^2}{2N}, \]

is subharmonic in $B_\rho(x_0)$. Therefore for every $\kappa \in (0,1)$ there is $C = C(\kappa,N)$ such that

$$
\delta_\rho := \sup_{B_{\sqrt{\kappa}\rho}} u \leq C \left( \frac{1}{\partial B_\rho} u \, d\mathcal{H}^{N-1} + \rho^2 \right) \leq C (m_\rho + \rho^2).
$$

(4.20)

Let $w$ be the solution of

$$
\begin{cases}
-\Delta w = 1 & \text{in } B_{\sqrt{\kappa}\rho} \setminus B_{\kappa \rho}, \\
\quad w = \delta_\rho & \text{on } \partial B_{\sqrt{\kappa}\rho}, \\
\quad w = 0 & \text{on } B_{\kappa \rho}.
\end{cases}
$$

Since $w \geq u$ on $\partial B_{\sqrt{\kappa}\rho}$, the function

$$
v = \begin{cases}
\quad u & \text{on } \mathbb{R}^N \setminus B_{\sqrt{\kappa}\rho}, \\
\quad \min\{u, w\} & \text{on } B_{\sqrt{\kappa}\rho},
\end{cases}
$$

satisfies

$$
\{v > 0\} \subset \{u > 0\} \quad \text{and} \quad \{v > 0\} \setminus B_{\sqrt{\kappa}\rho} = \{u > 0\} \setminus B_{\sqrt{\kappa}\rho}.
$$

In particular $v \in W^{1,2}_0(B_R)$ and (4.19) gives

$$
\frac{1}{2} \int_{B_{\sqrt{\kappa}\rho}} |\nabla u|^2 \, dx - \int_{B_{\sqrt{\kappa}\rho}} u \, dx + f_\rho(\{u > 0\}) \\
\leq \frac{1}{2} \int_{B_{\sqrt{\kappa}\rho}} |\nabla v|^2 \, dx - \int_{B_{\sqrt{\kappa}\rho}} v \, dx + f_\rho(\{v > 0\}) + C_2 \sigma \left( \{u > 0\} \setminus \{v > 0\} \right) \cap B_{\sqrt{\kappa}\rho}.
$$

(4.21)

Since $v = 0$ in $B_{\kappa \rho}$,

$$
|\{u > 0\} \cap B_{\kappa \rho}| \leq |\{u > 0\} \setminus \{v > 0\} \cap B_{\sqrt{\kappa}\rho}|.
$$

Using (4.7) and choosing $\sigma > 0$ such that $C_2 \sigma \leq \frac{\tilde{\eta}}{2}$, the above two equations and the definition of $v$ give

$$
\frac{1}{2} \int_{B_{\kappa \rho}} |\nabla u|^2 \, dx - \int_{B_{\kappa \rho}} u \, dx + \frac{\tilde{\eta}}{2} |\{u > 0\} \cap B_{\kappa \rho}| \\
\leq \frac{1}{2} \int_{B_{\kappa \rho}} |\nabla u|^2 \, dx - \int_{B_{\kappa \rho}} u \, dx + \frac{\tilde{\eta}}{2} |\{u > 0\} \setminus \{v > 0\} \cap B_{\sqrt{\kappa}\rho}| \\
\leq \frac{1}{2} \int_{B_{\sqrt{\kappa}\rho}} \left( |\nabla v|^2 - |\nabla u|^2 \right) \, dx - \int_{B_{\sqrt{\kappa}\rho} \setminus B_{\kappa \rho}} (v - u) \, dx \\
\leq \int_{(B_{\sqrt{\kappa}\rho} \setminus B_{\kappa \rho}) \cap \{u > w\}} (\nabla w)^2 - \nabla u \cdot \nabla w \, dx - \int_{(B_{\sqrt{\kappa}\rho} \setminus B_{\kappa \rho}) \cap \{u > w\}} (w - u) \, dx.
$$

Multiplying the equation satisfied by $w$ by $(u - w)_+$, integrating over $B_{\sqrt{\kappa}\rho} \setminus B_{\kappa \rho}$ we obtain

$$
\int_{(B_{\sqrt{\kappa}\rho} \setminus B_{\kappa \rho}) \cap \{u > w\}} (\nabla w)^2 - \nabla u \cdot \nabla w \, dx + \int_{(B_{\sqrt{\kappa}\rho} \setminus B_{\kappa \rho}) \cap \{u > w\}} (u - w) \, dx \\
= - \int_{\partial B_{\kappa \rho}} \frac{\partial w}{\partial \nu} u \, d\mathcal{H}^{N-1},
$$

(4.22)

since $w \equiv 0$ on $\partial B_{\kappa \rho}$ and $w \geq u$ on $\partial B_{\sqrt{\kappa}\rho}$. An explicit computation gives

$$
\left| \frac{\partial w}{\partial \nu} \right| \leq C(N, \kappa) \, \delta_\rho + \frac{\rho^2}{\rho} \quad \text{on } \partial B_{\kappa \rho},
$$

and combining (4.21) and (4.22) we get

$$
\frac{1}{2} \int_{B_{\kappa \rho}} |\nabla u|^2 \, dx - \int_{B_{\kappa \rho}} u \, dx + \frac{\tilde{\eta}}{2} |\{u > 0\} \cap B_{\kappa \rho}| \leq C \frac{\delta_\rho + \rho^2}{\rho} \int_{\partial B_{\kappa \rho}} u \, d\mathcal{H}^{N-1}.
$$

(4.23)
Now the classical trace inequality in $W^{1,1}$, (4.20) and Cauchy-Schwarz inequality imply
\[
\int_{\partial B_{\kappa \rho}} u \, d\mathcal{H}^{N-1} \leq C(N, \kappa) \left( \frac{1}{2} \int_{B_{\kappa \rho}} u \, dx + \int_{B_{\kappa \rho}} |\nabla u| \, dx \right)
\leq C(N, \kappa) \left( \left( \delta + \frac{1}{2} \right) \{u > 0\} \cap B_{\kappa \rho} \right) + \frac{1}{2} \int_{B_{\kappa \rho}} |\nabla u|^2 \, dx.
\]
Combining the above estimate with (4.23), recalling (4.20) and choosing $m$ and $\varrho_0$ such that $(m + \varrho) C(N, \kappa) \leq \tilde{\eta}/4$, we obtain
\[
\frac{\tilde{\eta}}{2} \left( \int_{{\kappa \rho}} |\nabla u|^2 \, dx + |\{u > 0\} \cap B_{\kappa \rho}| \right) \leq (m + \varrho) C \left( \int_{B_{\kappa \rho}} |\nabla u|^2 \, dx + |\{u > 0\} \cap B_{\kappa \rho}| \right)
\leq \frac{\tilde{\eta}}{4} \left( \int_{B_{\kappa \rho}} |\nabla u|^2 \, dx + |\{u > 0\} \cap B_{\kappa \rho}| \right).
\]
This clearly implies $u = 0$ on $B_{\kappa \rho}$.

**Lemma 4.10.** Let $u_j$ be as in Lemma 4.9. There exists a constant $M$ depending only on the dimension and on $R$, such that if $x_0 \in B_R$ and
\[
\text{(4.24)} \quad \oint_{\partial B_{\varrho}(x_0) \cap B_R} u_j \, d\mathcal{H}^{N-1} \geq M \varrho,
\]
then $u_j > 0$ in $B_{\varrho}(x_0)$.

**Proof.** Again we drop the subscript $j$. First notice that if $M$ is large enough and (4.24) holds true then necessarily $B_{\varrho}(x_0) \subset B_R$. Indeed, remember that $-\Delta u \leq 1$ in $B_R$, then by the maximum principle
\[
u(x) \leq \frac{R^2 - |x|^2}{2N}, \quad x \in B_R.
\]
Thus, if $B_{\varrho}(x_0) \cap \partial B_R \neq \emptyset$ then
\[
\oint_{\partial B_{\varrho}(x_0) \cap B_R} u \, d\mathcal{H}^{N-1} \leq C(N, R) \varrho,
\]
for some constant depending only on $R$ and $N$ and this would contradict (4.24) if $M > C(N, R)$. Then we can always assume that $B_{\varrho}(x_0) \subset B_R$. Let us now define $v \in W_0^{1,2}(B_R)$ as
\[
\begin{cases}
-\Delta v = 1 & \text{on } B_{\varrho} \\
v = u & \text{in } \mathbb{R}^N \setminus B_{\varrho},
\end{cases}
\]
where we simply write $B_{\varrho}$ for $B_{\varrho}(x_0)$, since $x_0$ is fixed. Of course, by the maximum principle there holds $v > 0$ in $B_{\varrho}$ and since $u = v$ in the complementary of $B_{\varrho}$, we get
\[
\{u > 0\} \Delta \{v > 0\} = \{u = 0\} \cap B_{\varrho}.
\]
Using this, (4.19) and (4.7) we get
\[
\frac{1}{2} \int_{B_{\varrho}} |\nabla u|^2 \, dx - \int_{B_{\varrho}} u \, dx \leq \frac{1}{2} \int_{B_{\varrho}} |\nabla v|^2 \, dx - \int_{B_{\varrho}} v \, dx + \left( \frac{1}{\eta} + C_2 \sigma \right) |\{u = 0\} \cap B_{\varrho}|.
\]
By appealing to the equation satisfied by $v$ and the fact $\sigma < 1 < 1/\tilde{\eta}$, the above equation becomes
\[
\text{(4.25)} \quad \frac{1}{2} \int_{B_{\varrho}} |\nabla u - \nabla v|^2 \, dx \leq \frac{C_2 + 1}{\tilde{\eta}} |\{u = 0\} \cap B_{\varrho}|.
\]
Through the scaling

\[ u(x) \mapsto \frac{1}{\varrho} u(x_0 + \varrho x), \]

we can assume that \( \varrho = 1 \). We want to bound the left-hand side of (4.25) from below by a multiple of the right-hand side. In order to do this we fix two points \( y_1 \) and \( y_2 \) in \( B_{1/4} \) such that \( B_{1/8}(y_1) \) and \( B_{1/8}(y_2) \) are disjoint and contained in \( B_{1/2} \). For \( i = 1, 2 \), let \( \zeta_i : \mathbb{S}^{N-1} \to \mathbb{R}^+ \) be such that

\[ \partial B_1 = \{ y_i + \zeta_i(\theta) \theta : \theta \in \mathbb{S}^{N-1} \}. \]

Let us define

\[ \psi_i(\theta) = y_i + r_i(\theta) \theta, \]

where

\[ r_i(\theta) = \inf \left\{ \frac{1}{8} \leq r \leq \zeta_i(\theta) : u(y_i + r \theta) = 0 \right\}. \]

and we set the above infimum to be \( \zeta_i(\theta) \) if no such \( r \) exists. That is \( \psi_i(\theta) \) is the first point outside \( B_{1/8} \) and lying on the segment joining \( y_i \) to \( y_i + \zeta_i(\theta) \theta \) where \( u \) vanishes. Hence

\[ v(\psi_i(\theta)) = v(\psi_i(\theta)) - u(\psi_i(\theta)) \]

\[ \leq \int_{r_i(\theta)}^{\zeta_i(\theta)} |\nabla u - \nabla v|(y_i + r \theta) \, dr \]

\[ \leq \sqrt{\zeta_i(\theta) - r_i(\theta)} \left( \int_{r_i(\theta)}^{\zeta_i(\theta)} |\nabla u - \nabla v|^2(y_i + r \theta) \, dr \right)^{1/2}. \]

By the maximum principle \( v \) is above the harmonic function sharing the same boundary data of \( u \), hence, by the Poisson representation formula it follows that

\[ v(\psi_i(\theta)) \geq c(N) \left( 1 - |\psi_i(\theta)| \right) \int_{\partial B_1} u \, d\mathcal{H}^{N-1}. \]

By elementary geometric considerations (see Figure 4.1),

\[ 1 - |\psi_i(\theta)| \geq c \, |\zeta_i(\theta) - r_i(\theta)|, \]

and by construction

\[ |\zeta_i(\theta) - r_i(\theta)| \geq \mathcal{H}^1(\{ r \in [1/8, \zeta_i(\theta) ] : u(y_i + r \theta) = 0 \}). \]
Then integrating over \( \theta \in \mathbb{S}^{N-1} \) and using that \( r_i(\theta) \geq 1/8, \) (4.27), (4.28), (4.25) and our assumption (recall that we have set \( \rho = 1 \)) imply
\[
M^2 \left( \{ u = 0 \} \cap (B_1 \setminus B_{1/8}(y_1)) \right) \leq C(N, R) \left( \{ u = 0 \} \cap B_1 \right).
\]

Since the balls \( B_{1/8}(y_1) \) and \( B_{1/8}(y_2) \) are disjoint, this gives
\[
\frac{M^2}{2} \left| \{ u = 0 \} \cap B_1 \right| \leq C(N, R) \left( \{ u = 0 \} \cap B_1 \right).
\]

By choosing \( M \) large enough, the previous implies that \( \{ u = 0 \} \cap B_1 = 0 \). \( \square \)

From Lemma 4.9 and 4.10, exactly as in [3, Section 3], we obtain the following.

**Lemma 4.11** (Properties of minimizers, Part II). Let \( u_j \) be as above, then \( \Omega_j = \{ u_j > 0 \} \) is an open set. Moreover there exists a constant \( C_6 = C_6(N, R) \) and a radius \( \rho_0 = \rho_0(N, R) \) such that

(i) For every \( x \in \Omega_j \) it holds
\[
\frac{1}{C_6} \text{dist} (x, \partial \Omega_j) \leq u_j(x) \leq C_6 \text{dist} (x, \partial \Omega_j);
\]
(ii) the functions \( u_j \) are equi-Lipschitz \( \| \nabla u_j \|_{L^\infty(B_R)} \leq C_6; \)
(iii) for every \( x \in \partial \Omega_j \) and every \( \rho \leq \rho_0 \)
\[
\frac{1}{C_6} \leq \frac{\{ \Omega_j \cap B_\rho(x) \}}{\left| B_\rho(x) \right|} \leq C_6.
\]

As in [3, Theorem 4.5] we also have the following.

**Lemma 4.12.** Let \( u_j \) be as above, then there exists a Borel function \( q_{u_j} \) such that
\[
-\Delta u_j = 1_{\Omega_j} - q_{u_j} \mathcal{H}^{N-1} \cap \partial^* \Omega_j.
\]
In addition \( 0 < c \leq q_{u_j} \leq C, \) where \( c \) and \( C \) depends only on \( N \) and \( R \) and
\[
\mathcal{H}^{N-1}(\partial \Omega_j \setminus \partial^* \Omega_j) = 0.
\]

In the above Lemma \( \partial^* \Omega_j \) denotes the reduced boundary of the set of finite perimeter \( \Omega_j = \{ u_j > 0 \}. \) We recall (see [29, Chapter 15]) that for every \( \bar{x} \in \partial^* \{ u_j > 0 \}, \) there exists a unit vector \( \nu_{u_j}(\bar{x}) \) such that
\[
\frac{\{ u_j > 0 \} - \bar{x}}{\rho} \rightarrow \{ x : x \cdot \nu_{u_j}(\bar{x}) \geq 0 \} \quad \text{in} \quad L^1_{\text{loc}}(\mathbb{R}^N).
\]

Moreover for \( \mathcal{H}^{N-1} \) almost every \( \bar{x} \in \partial^* \{ u_j > 0 \}, \) it holds
\[
u_{u_j}(\bar{x}) := \frac{u_j(\bar{x} + \rho \bar{e})}{\rho} \rightarrow q_{u_j}(\bar{x})(x \cdot \nu_{u_j}(\bar{x}))_+ \quad \text{in} \quad W^{1,p}_{\text{loc}}(\mathbb{R}^N), \quad \text{for every} \quad p \in [1, +\infty).
\]

For the proofs of this last fact we refer to [3, Theorem 4.8]. The following simple Lemma is a standard consequence of Lemma 4.7 (ii) and of the density estimates (4.30).

**Lemma 4.13.** Every limit point \( \Omega_\infty \) of \( \Omega_j \) with respect to the \( L^1 \) convergence is a ball of radius \( 1 \) and center \( x_\infty \in B_R. \) Moreover
\[
\partial \Omega_j \rightarrow \partial B_1(x_\infty) \quad \text{in the Kuratowski sense}^5, \quad \text{as} \quad j \rightarrow +\infty.
\]

\(^4\)More precisely, in every Lebesgue point of \( q_{u_j} \) with respect to \( \mathcal{H}^{N-1} \cap \partial^* \{ u_j > 0 \}. \)

\(^5\)We recall that a sequence of sets \( \{ S_k \}_{k \in \mathbb{N}} \) converges to a set \( S \) in the Kuratowski sense if
- for every sequence of points \( x_k \in S_k \) any limit point belongs to \( S; \)
- for every point \( x \in S \) there is a sequence of point \( x_k \in S_k \) such that \( x_k \rightarrow x. \)
In particular for every \( \delta > 0 \) there exists a \( j_\delta \in \mathbb{N} \) such that

\[
B_{1-\delta}(x_j) \subset \Omega_j \subset B_{1+\delta}(x_j), \quad \text{for all } j \geq j_\delta,
\]

where \( x_j \in B_R \).

We are now in position to address higher regularity of \( \partial \{u_j > 0\} \). Since \( u_j \) is a weak solution for \( q_{u_j} \) in the sense of [3, Section 5] and [22, Section 3], to apply their results we have to show that \( q_{u_j} \) is continuous. To identify \( q_{u_j} \) we try to write down the Euler-Lagrange equations for the problem (4.18). In order to do this we first have to show that \( \Omega_j = \{u_j > 0\} \) is minimal with respect to every (small) perturbation. This will be done in the next Lemma, where by \( N_\delta(A) \) we denote the \( \delta \) neighborhood of a generic set \( A \).

**Lemma 4.14.** Let \( R \geq 2 \), then for every \( 0 < 2 \delta < R - 1 \) there exists \( j_\delta \in \mathbb{N} \) such that for \( j \geq j_\delta \), the energy function \( u_j \) satisfies (4.18) for every \( v \in W^{1,2}_0(\mathcal{N}_\delta(\Omega_j)) \).

**Proof.** Let \( \delta \) be as in the statement, thanks to (4.34) we can assume that for \( j \geq j_\delta \) we have \( \Omega_j \subset B_{1+\delta}(x_j) \) for some \( x_j \in B_R \). The translated sets \( U_j = \Omega_j - x_j \) are such that

\[
U_j \subset B_{1+\delta}(0) \subset B_R,
\]

so that \( \mathcal{N}_\delta(U_j) \subset B_R \). Moreover, we have \( \mathcal{G}_{\tilde{q},j}(\Omega_j) = \mathcal{G}_{\tilde{q},j}(U_j) \), as the functional is translation invariant. Translating back this proves the claim. \( \square \)

It is not difficult to see that the formal optimality condition for (4.18) reads as

\[
\left| \frac{\partial u_j(x)}{\partial \nu} \right|^2 \leq \frac{\sigma^2(\alpha(\Omega_j) - \varepsilon_j)}{\sqrt{\varepsilon_j^2 + \sigma^2(\alpha(\Omega_j) - \varepsilon_j)^2}} \left[ |x - x_{\Omega_j}| - \left( \int_{\Omega_j} \frac{y - x_{\Omega_j}}{|y - x_{\Omega_j}|} dy \right) \cdot x \right] = \Lambda_j,
\]

for some constant \( \Lambda_j \). The goal of next Lemma is to show that this is actually the case, at least for \( \mathcal{H}^{N-1} \cap \partial^* \Omega_j \) almost every point.

**Lemma 4.15.** Let \( R \geq 2 \) and \( u_j \) be as in Lemma 4.7. There exists \( \tilde{j} = \tilde{j}(R) \) such that if \( j \geq \tilde{j} \), the following holds:

\[
(q_{u_j}(x_1))^2 - \frac{\sigma^2(\alpha(\Omega_j) - \varepsilon_j)}{\sqrt{\varepsilon_j^2 + \sigma^2(\alpha(\Omega_j) - \varepsilon_j)^2}} \left[ |x_1 - x_{\Omega_j}| - \left( \int_{\Omega_j} \frac{y - x_{\Omega_j}}{|y - x_{\Omega_j}|} dy \right) \cdot x_1 \right] = (q_{u_j}(x_2))^2 - \frac{\sigma^2(\alpha(\Omega_j) - \varepsilon_j)}{\sqrt{\varepsilon_j^2 + \sigma^2(\alpha(\Omega_j) - \varepsilon_j)^2}} \left[ |x_2 - x_{\Omega_j}| - \left( \int_{\Omega_j} \frac{y - x_{\Omega_j}}{|y - x_{\Omega_j}|} dy \right) \cdot x_2 \right],
\]

for every two points \( x_1 \) and \( x_2 \) in \( \partial^* \{u_j > 0\} \) such that (4.32) and (4.33) hold true.

**Proof.** We choose \( \delta = (R - 1)/4 \) and fix \( j \geq j_\delta \), where \( j_\delta \) is as in Lemma 4.14. Being \( j \) fixed we drop the subscript and, for notational simplicity, we assume that \( x_\Omega = 0 \).

Let us assume by contradiction that there are two points \( x_1 \) and \( x_2 \) satisfying (4.32) and (4.33) such that the left-hand side of (4.35) is strictly smaller than the right-hand side.

Following [2] we are going to construct a small variation of \( \Omega = \{u > 0\} \) which preserves the volume to the first order and which contradicts (4.18). In order to do this let us take a smooth
radial symmetric function \( \phi(y) = \phi(|y|) \) compactly supported in \( B_1 \) and let us define, for \( \tau, \varrho \) small

\[
\Phi^\varrho_\tau(x) = \begin{cases} 
  x + \tau \varrho \phi\left( \left| \frac{x-x_1}{\varrho} \right| \right) \nu_u(x_1), & x \in B_\varrho(x_1), \\
  x - \tau \varrho \phi\left( \left| \frac{x-x_2}{\varrho} \right| \right) \nu_u(x_2), & x \in B_\varrho(x_2), \\
  x, & \text{otherwise.}
\end{cases}
\] (4.36)

For \( \tau \) small and independent of \( \varrho \), \( \Phi^\varrho_\tau \) is easily seen to be a diffeomorphism. Moreover, still for \( \tau \) small, thanks to Lemma 4.14 the function

\[
u^\varrho_\tau := u \circ (\Phi^\varrho_\tau)^{-1},
\]

is an admissible competitor for testing the minimality of \( u \), notice that

\[\Omega^\varrho_\tau := \{x : \nu^\varrho_\tau(x) > 0\} = \Phi^\varrho_\tau(\Omega).\]

We now start computing the variations of all the terms involved in the definition of \( G_{\tilde{\eta}, \tilde{\eta}} \).

- **Volume term.** We compute

\[
\frac{|\Omega^\varrho_\tau| - |\Omega|}{\varrho^N} = \frac{1}{\varrho^N} \int_{\Omega} [\text{det } \nabla \Phi^\varrho_\tau - 1] \, dx
\]

\[
= \tau \frac{1}{\varrho^N} \left( \int_{\Omega \cap B_{\varrho}(x_1)} \phi^\prime\left( \left| \frac{x-x_1}{\varrho} \right| \right) \frac{(x-x_1) \cdot \nu_u(x_1)}{|x-x_1|} \, dx 
- \int_{\Omega \cap B_{\varrho}(x_2)} \phi^\prime\left( \left| \frac{x-x_2}{\varrho} \right| \right) \frac{(x-x_2) \cdot \nu_u(x_2)}{|x-x_2|} \, dx \right) + o(\tau),
\]

where \( o(\tau) \) is independent on \( \varrho \). Hence, recalling (4.32), changing variables and applying the Divergence Theorem in the last step

\[
\lim_{\varrho \to 0} \frac{|\Omega^\varrho_\tau| - |\Omega|}{\varrho^N} = \tau \left( \int_{\{y: \nu_u(x_1) \geq 0\} \cap B_1} \phi^\prime(|y|) \frac{y \cdot \nu_u(x_1)}{|y|} - \int_{\{y: \nu_u(x_2) \geq 0\} \cap B_1} \phi^\prime(|y|) \frac{y \cdot \nu_u(x_2)}{|y|} \right) + o(\tau)
\]

\[
= -\tau \left( \int_{\{y: \nu_u(x_1) = 0\} \cap B_1} \phi(|y|) - \int_{\{y: \nu_u(x_2) = 0\} \cap B_1} \phi(|y|) \right) + o(\tau) = o(\tau),
\]

where we used that the integrals are equal thanks to the radial symmetry of \( \phi \).

- **Dirichlet integral and \( L^1 \) norm.** By changing variables,

\[
\frac{1}{\varrho^N} \left[ \int |\nabla u^\varrho_\tau|^2 \, dx - \int |\nabla u|^2 \, dx \right]
\]

\[
= \frac{1}{\varrho^N} \left[ \int_{\Omega \cap B_{\varrho}(x_1)} \left[ |(\nabla \Phi^\varrho_\tau)^{-1} \nabla u|^2 \text{det } \nabla \Phi^\varrho_\tau - |\nabla u|^2 \right] + \int_{\Omega \cap B_{\varrho}(x_2)} \left[ |(\nabla \Phi^\varrho_\tau)^{-1} \nabla u|^2 \text{det } \nabla \Phi^\varrho_\tau - |\nabla u|^2 \right] \right]
\]

\[
= \frac{\tau}{\varrho^N} \left[ \int_{\Omega \cap B_{\varrho}(x_1)} |\nabla u(x_1 + \varrho y)|^2 \phi^\prime(|y|) \nu_u(x_1) \cdot y - 2 \phi^\prime(|y|) \frac{(\nabla u(x_1 + \varrho y) \cdot y)(\nabla u(x_1 + \varrho y) \cdot \nu_u(x_1))}{|y|} \right] 
- \int_{\Omega \cap B_{\varrho}(x_2)} |\nabla u(x_2 + \varrho y)|^2 \phi^\prime(|y|) \nu_u(x_2) \cdot y - 2 \phi^\prime(|y|) \frac{(\nabla u(x_2 + \varrho y) \cdot y)(\nabla u(x_2 + \varrho y) \cdot \nu_u(x_2))}{|y|} \right] + o(\tau),
\]
with \( o(\tau) \) independent on \( \varrho \). Hence, recalling (4.33) and (4.32), thanks to the Divergence Theorem we obtain

\[
\lim_{\varrho \to 0} \frac{1}{\varrho^N} \left( \int |\nabla u_\varrho|^2 - \int |\nabla u|^2 \right) = \tau \left[ (q_\varrho(x_1))^2 - (q_\varrho(x_2))^2 \right] \int_{\{y_1=0\} \cap B_1} \phi(|y|) + o(\tau).
\]

With a similar computation and recalling (4.33),

\[
\lim_{\varrho \to 0} \frac{1}{\varrho^N} \left[ \int u_\varrho^2 dx - \int u dx \right] = o(\tau).
\]

- **Barycenter.** First of all, recall that we have set \( x_\Omega = 0 \). So we only have to compute

\[
\frac{x_\Omega^\varrho}{\varrho^N} = \frac{1}{\varrho^N} \left( \frac{1}{|\Omega^\varrho|} \int_{\Omega^\varrho} \Phi^\varrho_\tau(x) \det \nabla \Phi^\varrho_\tau(x) dx - \frac{1}{\Omega^\varrho} \int_{\Omega^\varrho} x dx \right)
\]

\[
= \frac{1}{\varrho^N} \left[ \int_{\Omega^\varrho} \Phi^\varrho_\tau(x) \det \nabla \Phi^\varrho_\tau(x) dx - \frac{1}{\Omega^\varrho} \int_{\Omega^\varrho} x dx \right] + o(1) + o(\tau),
\]

where we have taken into account (4.37) in the second equality and \( o(1) \) tends to 0 in \( \varrho \) for fixed \( \tau \), while \( o(\tau) \) is independent on \( \varrho \). Arguing as above, one checks that thanks to (4.32),

\[
\lim_{\varrho \to 0} \frac{x_\Omega^\varrho}{\varrho^N} = \lim_{\varrho \to 0} \frac{1}{\varrho^N} \left[ \int_{\Omega^\varrho} \Phi^\varrho_\tau(x) \det \nabla \Phi^\varrho_\tau(x) dx - \frac{1}{\Omega^\varrho} \int_{\Omega^\varrho} x dx \right] + o(\tau)
\]

\[
= -\tau \frac{(x_1 - x_2)}{|\Omega|} \left[ \int_{\{y_1=0\} \cap B_1} \phi(|y|) dy \right] + o(\tau).
\]

- **Asymmetry.** Recalling (4.2) and that we have set \( x_\Omega = 0 \),

\[
\frac{\alpha(\Omega^\varrho) - \alpha(\Omega)}{\varrho^N} = \frac{1}{\varrho^N} \left[ \int_{\Omega \cap B_\varrho(x_1)} \left( |\Phi^\varrho_\tau(x)| \det \nabla \Phi^\varrho_\tau(x) - |x| \right) dx + \int_{\Omega \cap B_\varrho(x_2)} \left( |\Phi^\varrho_\tau(x)| \det \nabla \Phi^\varrho_\tau(x) - |x| \right) - \left( \int_{\Omega^\varrho} \frac{y}{|y|} \right) : x_{\varrho} \right]
\]

\[
+ o(1) + o(\tau)
\]

where we used (4.37) and (4.40). Here again \( o(1) \) tends to 0 in \( \varrho \) for fixed \( \tau \), while \( o(\tau) \) is independent on \( \varrho \). With a computation similar to the previous ones

\[
\lim_{\varrho \to 0} \frac{1}{\varrho^N} \left[ \int_{\Omega \cap B_\varrho(x_i)} \left( |\Phi^\varrho_\tau(x)| \det \nabla \Phi^\varrho_\tau(x) - |x| \right) \right] = \tau(-1)^i |x_i| \int_{\{y_1=0\} \cap B_1} \phi(|y|) + o(\tau).
\]

for \( i = 1, 2 \). Hence we finally get

\[
\lim_{\varrho \to 0} \frac{\alpha(\Omega^\varrho) - \alpha(\Omega)}{\varrho^N} = -\tau \left[ \int_{\{y_1=0\} \cap B_1} \phi(|y|) \right] \left[ |x_1| - |x_2| + \left( \int_{\Omega^\varrho} \frac{y}{|y|} \right) : \frac{x_1 - x_2}{|\Omega|} \right] + o(\tau).
\]

- **Expansion of \( G_{\hat{\eta}, \tilde{J}} \).** By (4.37) and (4.7), we get

\[
\frac{1}{\varrho^N} \left| f_\varrho(|\Omega^\varrho|) - f_\varrho(|\Omega|) \right| \leq \frac{1}{\varrho^N} \left| \frac{|\Omega^\varrho| - |\Omega|}{\varrho^N} \right| = o(1) + o(\tau).
\]
Thus by using (4.38), (4.39), (4.40) and (4.42) we can infer
\[
\left[ \int_{\{y_1=0\} \cap B_1} \phi(|y|) \right]^{-1} \frac{G_{\hat{\eta},j}(\Omega_x^e) - G_{\hat{\eta},j}(\Omega)}{q^N}
\leq \tau \left\{ (q_u(x_1))^2 - \frac{\sigma^2(\alpha(\Omega) - \varepsilon)}{\sqrt{\varepsilon^2 + \sigma^2(\alpha(\Omega) - \varepsilon)^2}} \left[ |x_1| - \left( \int_{\Omega_x} \frac{y}{|y|} \cdot x \right) \right] \right.
- \left. (q_u(x_2))^2 + \frac{\sigma^2(\alpha(\Omega) - \varepsilon)}{\sqrt{\varepsilon^2 + \sigma^2(\alpha(\Omega) - \varepsilon)^2}} \left[ |x_2| - \left( \int_{\Omega_x} \frac{y}{|y|} \cdot x_2 \right) \right] + o_\varepsilon(1) + o(\tau). \right\}
\]
Since we are supposing that the quantity into braces is strictly negative, the previous estimate contradicts the minimality of \( \Omega \) for \( \varrho, \tau \) small.

**Lemma 4.16.** There exist \( \sigma_3 = \sigma_3(N, R) > 0 \), \( \hat{j} = \hat{j}(N, R) \) and \( \hat{\delta} = \hat{\delta}(N, R) > 0 \) such that for every \( j \geq \hat{j} \) and every \( \sigma \leq \sigma_3 \) the functions \( q_{u_j} \) are in \( C^\infty(\mathcal{N}_{\hat{\delta}}(\partial \Omega_j)) \). Moreover
\[
\| q_{u_j} \|_{C^k(\mathcal{N}_{\hat{\delta}}(\partial \Omega_j))} \leq C(k, N, R), \quad \text{for every } j \geq \hat{j}.
\]

**Proof.** From Lemma 4.15 we see that, for \( j \) large there exists \( \Lambda_j \in \mathbb{R} \) such that
\[
(q_{u_j}(x))^2 = \Lambda_j + \frac{\sigma^2(\alpha(\Omega_j) - \varepsilon_j)}{\varepsilon_j^2 + \sigma^2(\alpha(\Omega_j) - \varepsilon_j)^2} \left[ |x - x_{\Omega_j}| - \left( \int_{\Omega_x} \frac{y - x_{\Omega_j}}{|y - x_{\Omega_j}|} \cdot x \right) \right],
\]
for \( \mathcal{H}^{N-1} \)-almost every \( x \in \partial \{ u_j > 0 \} \). Since
\[
\left| \frac{\sigma^2(\alpha(\Omega_j) - \varepsilon_j)}{\varepsilon_j^2 + \sigma^2(\alpha(\Omega_j) - \varepsilon_j)^2} \left[ |x - x_{\Omega_j}| - \left( \int_{\Omega_x} \frac{y - x_{\Omega_j}}{|y - x_{\Omega_j}|} \cdot x \right) \right] \right| \leq C(N, R) \sigma,
\]
and by Lemma 4.12 \( q_{u_j} \) is bounded from above and below independently on \( j \), there exists a \( \sigma_3 = \sigma_3(N, R) \) such that for \( \sigma \leq \sigma_3 \) we have that \( \Lambda_j \) is also bounded from above and below independently on \( j \). Thanks to (4.34)
\[
|x - x_{\Omega_j}| \geq \frac{1}{2}, \quad \text{for every } j \text{ large.}
\]
Hence we can find \( \hat{\delta} = \hat{\delta}(N, R) \) such that
\[
q_{u_j}(x) = \left( \Lambda_j + \frac{\sigma^2(\alpha(\Omega_j) - \varepsilon_j)}{\varepsilon_j^2 + \sigma^2(\alpha(\Omega_j) - \varepsilon_j)^2} \left[ |x - x_{\Omega_j}| - \left( \int_{\Omega_x} \frac{y - x_{\Omega_j}}{|y - x_{\Omega_j}|} \cdot x \right) \right] \right)^{1/2}
\]
is smooth in the neighborhood \( \mathcal{N}_{\hat{\delta}}(\partial \Omega_j) \) and all its \( C^k \) norms are bounded, independently of \( j \). \( \square \)

We are in the position to apply the results\(^6\) of Sections 7 and 8 of [3]. We start recalling the following definition, see [3, Definition 7.1].

**Definition 4.17.** Let \( \mu_-, \mu_+ \in (0, 1], \kappa > 0 \). A weak solution \( u \) of (4.31) is said to be of class \( F(\mu_-, \mu_+, \kappa) \) in \( B_o(x_0) \) with respect to a direction \( \nu \in \mathbb{S}^{N-1} \) if (see Figure 4.2)

(a) \( x_0 \in \partial \{ u > 0 \} \) and
\[
u = 0 \quad \text{for } (x - x_0) \cdot \nu \leq -\mu_- \varrho,
\]
\[
u \geq q_u(x_0) [(x - x_0) \cdot \nu - \mu_+ \varrho] \quad \text{for } (x - x_0) \cdot \nu \geq \mu_+ \varrho.
\]

\(^6\)See also [22, Appendix], where it is sketched how to modify the proofs in [3] to deal with the case in which the function \( u \) has bounded laplacian on \( \{ u > 0 \} \).
Figure 4.2. A weak solution of (4.31) of class $F(\mu_-,\mu_+)$ in $B_\varrho(x_0)$ with respect to the direction $\nu$.

(b) $|\nabla u(x_0)| \leq q_u(x_0)(1 + \kappa)$ in $B_\varrho(x_0)$ and $\text{osc}_{B_\varrho(x_0)} q_u \leq \kappa q_u(x_0)$.

With this definition we can state the main Theorem of [3], which affirms that if the free boundary is flat enough, then it is smooth.

Theorem 4.18. [3, Theorem 8.1][26, Theorem 2]. Let $u$ be a weak solution of (4.31) in $B_R$ and assume that $q_u$ is Lipschitz continuous. There are constants $\gamma, \mu, \bar{\kappa}$ and $C$ depending only on $\min q_u$, $\max q_u$, $\text{Lip}(q_u)$, $R$ and the dimension $N$ such that:

If $u$ is of class $F(\mu,1,\infty)$ in $B_{4\varrho}(x_0)$ with respect to some direction $\nu \in S^{N-1}$ with $\mu \leq \bar{\mu}$ and $\varrho \leq \bar{\kappa}\mu^2$, then there exists a $C^{1,\gamma}$ function $f : \mathbb{R}^N \to \mathbb{R}$ with $\|f\|_{C^{1,\gamma}} \leq C\mu$, such that, if we define

$$\text{graph}_uf = \{ x \in \mathbb{R}^N : x \cdot \nu = f(x - (x \cdot \nu)) \},$$

then

$$\partial\{u > 0\} \cap B_\varrho(x_0) = (x_0 + \text{graph}_uf) \cap B_\varrho(x_0).$$

Moreover if $q_u \in C^{k,\gamma}$ in some $\delta$-neighborhood of $\{u_j > 0\}$, then $f \in C^{k+1,\gamma}$ and $\|f\|_{C^{k+1,\gamma}} \leq C(N,R,\|q_u\|_{C^{k,\gamma}})$.

4.4. Proof of the Selection Principle. With the aid of Theorem 4.18, we can now prove Proposition 4.4.

Proof of Proposition 4.4. Let $\Omega_j = \{u_j > 0\}$ be the solutions of (4.10). Without loss of generality, we can assume that $x_{\Omega_j} = 0$. Let $\bar{\mu}$ be as in Theorem 4.18 and let $\mu \ll \bar{\mu}$ to be fixed later. By the smoothness of $\partial B_1$, there exists a $\varrho(\mu)$ such that for every $\varrho \leq \varrho(\mu)$, $\bar{x} \in \partial B_1$

$$\partial B_1 \cap B_{5\varrho}(\bar{x}) \subset \{ x : |(x - \bar{x}) \cdot \nu_{2\varrho}| \leq \mu \varrho \},$$

where $\nu_{2\varrho}$ is the interior normal to $\partial B_1$ at $\bar{x}$. We can also assume that $\varrho(\mu) \leq \bar{\tau}\mu^2$ where $\bar{\tau}$ is as in Theorem 4.18. Since, up to translation, by Lemma 4.13 $\partial \Omega_j$ are converging in the sense of Kuratowski to $\partial B_1$, for $j$ large (depending on $\mu$) there exists a point $x_0 \in \partial \Omega_j \cap B_{\varrho(\mu)}(\bar{x})$ such that

$$\partial \Omega_j \cap B_{4\varrho(\mu)}(x_0) \subset \mathcal{N}_{\mu\varrho(\mu)}(\partial B_1 \cap B_{5\varrho(\mu)}(\bar{x})) \subset \{ x : |(x - x_0) \cdot \nu_{2\varrho}| \leq 4\mu\varrho(\mu) \}.$$
This means that \( u_j \) is of class \( F(\mu, 1, +\infty) \) in \( B_{\varrho(\mu)}(x_0) \) with respect to the direction \( \nu_x \) and hence, by our assumptions on \( \mu \) and \( \varrho(\mu) \), Lemma 4.16 and Theorem 4.18, \( \partial \Omega_j \cap B_{\varrho(\mu)}(x_0) \) is the graph of a smooth function with respect to \( \nu_x \). Choosing \( \mu \) smaller we see that there exist smooth functions \( g^\phi_j \) with uniformly bounded \( C^k \) norms such that

\[
\partial \Omega_j \cap B_{\varrho(\mu)}(\bar{x}) = \left\{ x + g^\phi_j(x) : x \in \partial B_1 \right\} \cap B_{\varrho(\mu)}(\bar{x}).
\]

Hence by the Ascoli-Arzelà Theorem and (4.34) we obtain \( g_j \to 0 \) in \( C^{k-1}(\partial B_1) \).

We now define \( U_j = \lambda_j \Omega_j \) where \( \lambda_j^N = |B_1|/|\Omega_j| \). Clearly \( U_j \) still satisfies \( x_{U_j} = 0 \) and \( |U_j| = |B_1| \). Moreover, by Lemma 4.7 (i) we get \( |\lambda_j - 1| \leq C \sigma^4 \varepsilon_j \). Hence they are smoothly converging to \( B_1 \). In order to verify (4.6), we use Lemma 4.2 (ii) and Lemma 4.7 (i) to infer

\[
|\alpha(U_j) - \varepsilon_j| \leq |\alpha(\Omega_j) - \varepsilon_j| + |\alpha(U_j) - \alpha(\Omega_j)| \leq C (\sigma + \sigma^4) \varepsilon_j \leq C \sigma \varepsilon_j.
\]

Moreover, by the equation (4.7) and Lemma 4.7 (iii)

\[
\mathcal{F}_{\tilde{\eta}}(U_j) - \mathcal{F}_{\tilde{\eta}}(B_1) \leq (1 + C \sigma^4 \varepsilon_j) \mathcal{F}_{\tilde{\eta}}(\Omega_j) - \mathcal{F}_{\tilde{\eta}}(B_1) \leq C \sigma^4 \varepsilon_j,
\]

from which (4.6) immediately follows, since \( |U_j| = |B_1| \) implies

\[
\mathcal{F}_{\tilde{\eta}}(U_j) = E(U_j).
\]

This concludes the proof of the Selection Principle. □

5. Final step: proof of the Main Theorem

In this section we remove the restrictions in Theorem 4.3 and we give the proof of the Main Theorem. For this we need two preliminary results. The first one is an \( L^\infty \) estimate of the energy
function outside a ball in terms of the measure of \( \Omega \) outside a smaller ball, based on a De Giorgi-type iteration argument. The second one is a sub-optimal version of (2.7) whose proof can be found in [21].

**Lemma 5.1.** Let \( \Omega \subset \mathbb{R}^N \) be an open set with \( |\Omega| = |B_1| \) and let \( u_\Omega \in W^{1,2}_0(\Omega) \) be its energy function. Then there exists a dimensional constant \( C_7 \) such that for every \( R \geq 1 \) we have

\[
\|u_\Omega\|_{L^\infty(\Omega \setminus B_{R+1})} \leq C_7 |\Omega \setminus B_R|^{1/N}.
\]

**Proof.** Notice that (5.1) trivially holds if \( |\Omega \setminus B_R| = 0 \), hence we assume that \( |\Omega \setminus B_R| > 0 \). Let us define

\[
R_k = R + 1 - 2^{-k}, \quad k \in \mathbb{N},
\]

so that \( R_0 = R \) and \( \lim_{k \to \infty} R_k = R + 1 \) and let us consider the following family of radial cut-off functions \( \varphi_k(x) = \varphi_k(|x|) \), where \( \varphi_k = 0 \) on \([0, R_{k-1}]\), \( \varphi_k = 1 \) on \([R_k, +\infty)\) and it is linear in between. Let us also define the following family of levels

\[
s_k = M |\Omega \setminus B_R|^{1/N} (1 - 2^{-k}),
\]

where \( M \) is a constant which will be chosen later. Since \( u_\Omega \) satisfies

\[
\int \nabla u_\Omega \cdot \nabla v \, dx = \int v \, dx, \quad \text{for every} \quad v \in W^{1,2}_0(\Omega),
\]

by inserting the test function \( v_k = \varphi_k^2 (u_\Omega - s_k)_+ \in W^{1,2}_0(\Omega) \) standard computations lead to

\[
\int |\nabla (\varphi_k (u_\Omega - s_k)_+)|^2 \, dx = \int \varphi_k^2 (u_\Omega - s_k)_+ \, dx + \int |\nabla \varphi_k|^2 (u_\Omega - s_k)_+ \, dx.
\]

By [37, Theorem 1], we have

\[
\|u_\Omega\|_{L^\infty(\Omega)} \leq \|u_{B_1}\|_{L^\infty(B_1)} \leq C(N).
\]

Since \( |\nabla \varphi_k| \leq 2^k \) and \( 0 \leq \varphi_k \leq 1 \), by applying Sobolev inequality in (5.2) and using (5.3), we infer

\[
\int (\varphi_k (u_\Omega - s_k)_+)^2 \, dx \leq C \left| \{ \varphi_k (u_\Omega - s_k)_+ > 0 \} \right|^{2/N} \int |\nabla (\varphi_k (u_\Omega - s_k)_+)|^2 \, dx
\]

\[
\leq C \left| \{ \varphi_k (u_\Omega - s_k)_+ > 0 \} \right|^{2/N} \left[ \int \varphi_k^2 (u_\Omega - s_k)_+ \, dx + \int |\nabla \varphi_k|^2 (u_\Omega - s_k)_+ \, dx \right]
\]

\[
\leq C \left| \{ \varphi_k (u_\Omega - s_k)_+ > 0 \} \right|^{1+2/N},
\]

where \( C \) depends only on \( N \). Since

\[
\{ (u_\Omega - s_{k+1})_+ > 0 \} \cap (\Omega \setminus B_{R_k}) \subset \{ (u_\Omega - s_k)_+ > k+1 \} \cap (\Omega \setminus B_{R_k}),
\]

and \( s_{k+1} - s_k = M |\Omega \setminus B_R|^{1/N} 2^{-(k+1)} \), we obtain from (5.4)

\[
\left| \{ (u_\Omega - s_{k+1})_+ > 0 \} \cap (\Omega \setminus B_{R_{k+1}}) \right| \leq \frac{4^{k+1} (s_{k+1} - s_k)^2}{M^2 |\Omega \setminus B_{R_{k+1}}|^{2/N}} \left| \left\{ (u_\Omega - s_k)_+ > s_{k+1} - s_k \right\} \cap (\Omega \setminus B_{R_{k+1}}) \right|
\]

\[
\leq \frac{4^{k+1}}{M^2 |\Omega \setminus B_R|^{2/N}} \int \varphi_k^2 (u_\Omega - s_k)_+ \, dx
\]

\[
\leq C \frac{16^k}{M^2 |\Omega \setminus B_R|^{2/N}} \left| \left\{ (u_\Omega - s_k)_+ > 0 \right\} \cap (\Omega \setminus B_{R_{k+1}}) \right|^{1+2/N}.
\]

By defining

\[
a_k = \left| \{ (u_\Omega - s_k)_+ > 0 \} \cap (\Omega \setminus B_{R_{k+1}}) \right| \leq 1, \quad k \in \mathbb{N},
\]
we obtain the following non-linear recursive relation for $a_k$:

$$a_{k+1} \leq \frac{C}{M^2} 16^k a_{k+2}^{1+2/N}, \quad \text{for every } k \geq 1.$$ 

Choosing $M$ such that $C/M^2 = 16^{-N}$ one easily sees by induction that

$$a_k \leq \left( \frac{1}{16^{N/2}} \right)^{k-1}, \quad k \in \mathbb{N}.$$ 

This clearly implies that $\lim_{k \to \infty} a_k = 0$. By using the definition of $a_k$, this gives

$$\left| \{ (u - s_\infty) > 0 \} \cap (\Omega \setminus B_{R+1}) \right| = 0,$$

with $s_\infty = M |\Omega \setminus B_1|^{1/N} = C^{1/2} 4^N |\Omega \setminus B_1|^{1/N}$. This finally shows estimate (5.1). □

Lemma 5.2. There exists a constant $C_8 = C_8(N)$ such that for every open set $\Omega \subset \mathbb{R}^N$ with finite measure, there holds

$$E(\Omega) \left| \Omega \right|^{-\frac{N+2}{N}} - E(B) \left| B \right|^{-\frac{N+2}{N}} \geq \frac{1}{C_8} \lambda_{2,1}(\Omega)^{2/3}.$$

Proof. By recalling that

$$E(\Omega) = \frac{1}{2} \lambda_{2,1}(\Omega),$$

where $\lambda_{2,1}(\Omega)$ is defined in (1.6), this result corresponds to making the choices $p = 2$ and $q = 1$ in [21, Theorem 1]. □

In what follows, we set

$$D(\Omega) = E(\Omega) \left| \Omega \right|^{-\frac{N+2}{N}} - E(B) \left| B \right|^{-\frac{N+2}{N}},$$

for notational simplicity.

Lemma 5.3. There exist constants $C_9 = C_9(N)$, $\delta = \delta(N) > 0$ and $d = d(N)$ such that for every open set $\Omega \subset \mathbb{R}^N$ with $|\Omega| = |B_1|$ and $D(\Omega) \leq \delta$, we can find another open set $\tilde{\Omega}$ with $|\tilde{\Omega}| = |B_1|$, $\text{diam}(\tilde{\Omega}) \leq d$ and such that

$$A(\Omega) \leq A(\tilde{\Omega}) + C_9 D(\Omega) \quad \text{and} \quad D(\tilde{\Omega}) \leq C_9 D(\Omega).$$

Proof. Let us assume that the ball achieving the asymmetry of $\Omega$ is given by $B_1$. By using this and the quantitative information (5.5) we have, choosing $\delta(N)$ sufficiently small,

$$\left| \frac{\Omega \setminus B_1}{|B_1|} \right| \leq A(\Omega) \leq C_9^{1/4} D(\Omega)^{1/4} \leq C_9^{1/4} \delta(N)^{1/4} < \frac{1}{2}.$$

Let us now estimate the energy of $\Omega \cap B_{k+2}$ for $k \geq 0$. For every $k \in \mathbb{N}$, let $\varphi_k$ be the cut-off function defined by

$$\varphi_k(x) = \min \{ 1, (k + 2 - |x|)_{+} \}, \quad x \in \mathbb{R}^N,$$

which is supported in $B_{k+2}$ and is equal to 1 in $B_{k+1}$. Then clearly

$$u_k = \varphi_k u_\Omega \in W^{1,2}_0(\Omega \cap B_{k+2}).$$

Hence, by using the equation satisfied by $u$ and recalling that by (2.3),

$$E(\Omega) = -\frac{1}{2} \int u_\Omega \, dx,$$
we get
\[ E(\Omega \cap B_{k+2}) \leq \frac{1}{2} \int |\nabla u_k|^2 - \int u_k = \frac{1}{2} \int \nabla u_\Omega \cdot \nabla (u_\Omega \varphi_k^2) \, dx + \frac{1}{2} \int |\nabla \varphi_k|^2 u_k^2 - \int \varphi_k u_\Omega \]
\[ = \frac{1}{2} \int u_\Omega \varphi_k^2 \, dx + \frac{1}{2} \int |\nabla \varphi_k|^2 u_\Omega^2 \, dx - \int \varphi_k u_\Omega \, dx \]
\[ \leq E(\Omega) + \frac{1}{2} |\Omega \setminus B_{k+1}| \left( \sup_{\Omega \setminus B_{k+1}} u_\Omega + \sup_{\Omega \setminus B_{k+1}} u_\Omega^2 \right). \]

By setting
\[ b_k = \frac{|\Omega \setminus B_k|}{|B_1|}, \quad \text{for every } k \geq 1, \]
we have of course \( b_{k+1} \leq b_k \leq \cdots \leq b_1 \leq 1/2 \). Hence by recalling (5.1) we get
\[ E(\Omega \cap B_{k+2}) \leq E(\Omega) + C b_{k+1} \left[ b_k^{1/N} + b_k^{2/N} \right] \]
\[ \leq E(\Omega) + C b_k^{1 + \frac{1}{N}}. \]

Using the definition of \( b_k \) and the Saint-Venant inequality (2.5), equation (5.11) implies
\[ E(B_1) (1 - b_{k+2})^{\frac{N+2}{N}} = E(B_1) |B_1|^{-\frac{N+2}{N}} |\Omega \cap B_{k+2}|^{\frac{N+2}{N}} \]
\[ \leq E(\Omega \cap B_{k+2}) \leq E(\Omega) + C b_k^{1 + \frac{1}{N}} \]
\[ = E(B_1) + D(\Omega) + C b_k^{1 + 1/N}, \]
where in the last estimate we used the very definition of deficit. Hence, recalling that \( E(B_1) < 0 \) and that \( b_{k+2} \leq 1/2 \) we finally get
\[ b_{k+2} \leq 2^{2/N} \frac{N+2}{N} \left( 1 - (1 - b_{k+2})^{\frac{N+2}{N}} \right) \leq \hat{C} \left( D(\Omega) + b_k^{1+1/N} \right), \]
for a suitable constant \( \hat{C} \) depending only on the dimension \( N \). Let us now define
\[ \mathcal{K} = \max\{k \in \mathbb{N} : \text{ such that } b_k \geq 2 \hat{C} D(\Omega)\}, \]
which exists since \( b_k \to 0 \) as \( k \to \infty \). We claim that if we choose \( \delta(N) \) sufficiently small then
\[ \mathcal{K} \leq K(N), \]
for some \( K(N) \) depending only on \( N \). By noticing that for \( k + 2 \leq \mathcal{K} \), (5.12) and (5.8) give
\[ b_{k+2} \leq 2 (b_{k+2} - \hat{C} D(\Omega)) \leq 2 \hat{C} b_k^{1+1/N} \leq b_k^{1+1/2N}, \]
if \( \delta(N) \ll 1 \). Now, by iteration one easily notices that, as long as \( 2 \leq k \leq \mathcal{K} \),
\[ b_k \leq b_1^{1 + \frac{2}{N}}. \]
Hence, by (5.8) and (5.13), we deduce
\[ 2 \hat{C} D(\Omega) \leq b_\mathcal{K} \leq b_1^{1 + \frac{2}{N}} \leq (C D(\Omega))^{\frac{1+2}{N}}, \]
which gives the desired estimate (5.14).

By the definition of \( \mathcal{K} \), (5.13), and recalling the definition of \( b_k \), we immediately see that
\[ |\Omega \cap B_{\mathcal{K}+3}| \geq |B_1| (1 - b_{\mathcal{K}+1}) \geq |B_1| - 2 \hat{C} |B_1| D(\Omega), \]
\[ |\Omega \cap B_{\mathcal{K}+3}| \geq |B_1| (1 - b_{\mathcal{K}+1}) \geq |B_1| - 2 \hat{C} |B_1| D(\Omega), \]
\[ |\Omega \cap B_{\mathcal{K}+3}| \geq |B_1| (1 - b_{\mathcal{K}+1}) \geq |B_1| - 2 \hat{C} |B_1| D(\Omega), \]
Thus we can suppose that
\[ E(\Omega \cap B_{\bar{K} + 3}) \leq E(\Omega) + C b_{\bar{K} + 1}^{1+\frac{1}{N}} \leq E(\Omega) + C D(\Omega)^{1+1/N}. \]

Let us set
\[ \tilde{\Omega} = \frac{\Omega \cap B_{\bar{K}+3}}{r}, \quad \text{where} \quad r = \left( \frac{|\Omega \cap B_{\bar{K}+3}|}{|B_1|} \right)^{\frac{1}{N}}. \]

Clearly \(|\tilde{\Omega}| = |B_1|\), moreover equation (5.15) implies
\[ 1 - 2 \tilde{C} D(\Omega) \leq r^N \leq 1. \]

Hence (5.14), (5.16) and (5.17) give
\[ \text{diam}(\tilde{\Omega}) \leq d(N) \quad \text{and} \quad D(\tilde{\Omega}) \leq C D(\Omega), \]
with
\[ d(N) = 2 \frac{K(N) + 3}{1 - 2 \tilde{C} \delta}. \]

Observe that the latter is well-defined, up to choosing \( \delta \leq 1/(4 \tilde{C}) \). In order to conclude the proof we only have to show that the estimate on the asymmetry in (5.7) holds true. Let \( B_1(x_0) \) be the optimal ball for \( \tilde{\Omega} \) and let \( r \) be as above, so that \(|B_r(x_0)| = |\Omega \cap B_{\bar{K}+3}|\). By using (5.17) and that \( b_{\bar{K}+3} < 2 \tilde{C} D(\Omega) \) by definition of \( \bar{K} \), we obtain
\[ |B_1| A(\tilde{\Omega}) \leq |\Omega \Delta B_1(x_0/r)| \]
\[ \leq |(\Omega \cap B_{\bar{K}+3}) \Delta \Omega| + |(\Omega \cap B_{\bar{K}+3}) \Delta B_r(x_0/r)| + |B_r(x_0/r) \Delta B_1(x_0/r)| \]
\[ \leq C |B_1| D(\Omega) + r^N |\tilde{\Omega} \Delta B_1(x_0)| + \omega_N (1 - r^N) \]
\[ \leq |B_1| A(\tilde{\Omega}) + C D(\Omega), \]
which concludes the proof of the Lemma.

We can finally prove the Main Theorem.

*Proof of the Main Theorem.* By Proposition 2.1 it is enough to show that there exists a dimensional constant \( \sigma_E \) such that
\[ E(\Omega) |\Omega| - \frac{N+2}{N} - E(B) |B| - \frac{N+2}{N} \geq \sigma_E A(\Omega)^2, \quad \text{for all sets} \ \Omega. \]

Also, since the above inequality is scaling invariant, we can assume that \(|\Omega| = |B_1|\), without loss of generality. For notational simplicity, we keep on using the notation \( D \) introduced in (5.6).

Let \( \bar{\delta}(N) \leq 1 \) be the constant appearing in Lemma 5.3. If \( D(\Omega) \geq \bar{\delta}(N) \), then since \( A(\Omega) < 2 \) we get
\[ D(\Omega) \geq \frac{\bar{\delta}(N)}{4} A(\Omega)^2. \]

Thus we can suppose that \( D(\Omega) < \bar{\delta}(N) \). Thanks to Lemma 5.3, we can construct a new open set \( \tilde{\Omega} \) with \( \text{diam}(\tilde{\Omega}) \leq d(N) \) and \(|\tilde{\Omega}| = |B_1|\), which satisfies (5.7). Up to a translation we have \( \Omega \subset B_{d(N)} \), then by applying Theorem 4.3 with \( R = d(N) \) we have
\[ D(\tilde{\Omega}) \geq \bar{\delta}(d(N)) \alpha(\tilde{\Omega}), \quad \text{if} \quad \alpha(\tilde{\Omega}) \leq \bar{\varepsilon}(d(N)). \]

By appealing to Lemma 4.2 (i) and to the very definition of Fraenkel asymmetry, the previous implies
\[ D(\tilde{\Omega}) \geq \frac{\bar{\delta}(d(N)) |B_1|^2}{C_1} A(\tilde{\Omega})^2, \quad \text{if} \quad \alpha(\tilde{\Omega}) \leq \bar{\varepsilon}(d(N)). \]
On the other hand, in the case \( \alpha(\tilde{\Omega}) > \tilde{\varepsilon}(d(N)) \), let \( B \) be the ball (of radius 1) such that \( \mathcal{A}(\tilde{\Omega}) = |\tilde{\Omega} \Delta B|/|B| \). Since \( \tilde{\Omega} \subset B_{d(N)} \) it is immediate to check that \( B \subset B_{d(N)+3} \), hence Lemma 4.2 (ii) and \( \alpha(B) = 0 \) give

\[
\frac{\tilde{\varepsilon}(d(N))}{C_2(d(N) + 3) |B_1|} < \frac{\alpha(\tilde{\Omega})}{C_2(d(N) + 3) |B_1|} \leq \frac{\tilde{\Omega} \Delta B}{|B_1|} = \mathcal{A}(\tilde{\Omega}).
\]

Estimate (5.5) now implies\(^7\)

\[
D(\tilde{\Omega}) \geq \frac{A(\tilde{\Omega})^4}{C_8} \geq \left( \frac{\tilde{\varepsilon}(d(N))}{C_2(d(N) + 3) |B_1|} \right)^2 \frac{A(\tilde{\Omega})^2}{C_8}, \quad \text{if} \quad \alpha(\tilde{\Omega}) > \tilde{\varepsilon}(d(N)).
\]

Setting

\[
c = \min \left\{ \frac{\tilde{\varepsilon}(d(N)) |B_1|^2}{C_1}, \frac{1}{C_8} \left( \frac{\tilde{\varepsilon}(d(N))}{C_2(d(N) + 3) |B_1|} \right)^2 \right\},
\]

thanks to (5.7), (5.18) and (5.19) and since \( \tilde{\varepsilon}(N) \leq 1 \) we get

\[
c = \frac{c}{2} \mathcal{A}(\Omega) \leq \frac{c}{2} \left( \mathcal{A}(\tilde{\Omega}) + C_9 D(\Omega) \right)^2 \leq c \mathcal{A}(\tilde{\Omega})^2 + c C_9^2 D(\Omega)^2
\]

\[
\leq D(\tilde{\Omega}) + c C_9^2 D(\Omega)^2 \leq C_9 D(\Omega) + c C_9^2 D(\Omega)^2 \leq C_9 (1 + c C_9) D(\Omega).
\]

If we now define

\[
\sigma_E = \min \left\{ \frac{c}{2 C_9 (1 + c C_9)}, \frac{\tilde{\varepsilon}(N)}{4} \right\},
\]

we get the desired conclusion. \( \Box \)

**APPENDIX A. PROOF OF LEMMA 3.4**

In this Appendix we briefly sketch the proof of Lemma 3.4, referring to [16] for more details. We start with the following:

**Lemma A.1.** Given \( \gamma \in (0, 1] \) there exists \( \delta_4 = \delta_4(N, \gamma) > 0 \) and a modulus of continuity \( \tilde{\omega} \) such that for every nearly spherical set \( \Omega \) parametrized by \( \varphi \) with \( \| \varphi \|_{C^2, \gamma(\partial B_1)} \leq \delta_4 \) and \( |\Omega| = |B_1| \), we can find an autonomous vector field \( X_\varphi \) for which the following holds true:

(i) \( \text{div} X_\varphi = 0 \) in a \( \delta_4 \)-neighborhood of \( \partial B_1 \);

(ii) if \( \Phi_t := \Phi(t, x) \) is the flow of \( X_\varphi \), i.e.

\[
\partial_t \Phi_t = X_\varphi(\Phi_t), \quad \Phi_0(x) = x,
\]

then \( \Phi_1(\partial B_1) = \partial \Omega \) and \( |\Phi_t(B_1)| = |B_1| \) for all \( t \in [0, 1] \).

(iii) We have

\[
\| \Phi_t - \text{Id} \|_{C^{2, \gamma}} \leq \tilde{\omega}(\| \varphi \|_{C^2, \gamma(\partial B_1)}), \quad \text{for every} \quad t \in [0, 1],
\]

\[
\| \varphi - (X_\varphi \cdot \nu_{B_1}) \|_{H^{1/2}(\partial B_1)} \leq \tilde{\omega}(\| \varphi \|_{L^\infty(\partial B_1)}) \| \varphi \|_{H^{1/2}(\partial B_1)},
\]

and

\[
\| \psi_t \|_{C^{2, \gamma}(\partial B_1)} \leq \tilde{\omega}(\| \varphi \|_{C^2, \gamma(\partial B_1)}).
\]

\(^7\)We note that in this part of the argument it is not really needed the power law relation between \( D(\Omega) \) and \( \mathcal{A}(\Omega) \) given by (5.5), it would be sufficient to know that \( \mathcal{A}(\Omega) \to 0 \) as \( D(\Omega) \to 0 \).
where $u$ explicit expression for $X$ set, see [16, Proposition 1] and [1, Theorem 3.7]. In the case of the ball we can however give an explicit expression for $X$ in a neighborhood of $\partial B_1$. More precisely in polar coordinates, $x = \rho \theta$, $\theta = |x|$, $\theta = x/|x| \in \partial B_1$, we define for $|\rho - 1| \leq \delta_1 \ll 1$, 
\begin{equation}
X(\rho, \theta) = \frac{(1 + \varphi(\theta))^N - 1}{N \rho^{N-1}} \theta, \quad \Phi_t(\rho, \theta) = \left[\rho^N + t \left((1 + \varphi(\theta))^N - 1\right)\right]^{1/N} \theta,
\end{equation}
and we globally extend the vectorfield (and hence the flow) in order to satisfy (A.1). In this way points (i), (ii) and equations (A.1) and (A.3) follow by direct computation. For equation (A.2) notice that, on $\partial B_1$
\[ \varphi - X_\varphi \cdot \nu_{\partial B_1} = \frac{1}{N} \sum_{h=2}^{N} \binom{N}{h} \varphi^h. \]
Since harmonic functions minimize the Dirichlet energy with respect to their own boundary data we get (recalling the notations of Definition 3.2)
\[ \int_{B_1} \left| \nabla H(\varphi^h) \right|^2 \, dx \leq \int_{B_1} \left| \nabla (H(\varphi))^h \right|^2 \, dx, \quad \text{for every } h \geq 1. \]
Hence, a straightforward computation gives
\[ \left\| \varphi - (X_\varphi \cdot \nu_{\partial B_1}) \right\|_{H^{1/2}(\partial B_1)} \leq C(N) \left( \|H(\varphi)\|_{L^\infty(B_1)} + \|\varphi\|_{L^\infty(\partial B_1)} \right) \|\varphi\|_{H^{1/2}(\partial B_1)}. \]
Since, by the maximum principle, $\|H(\varphi)\|_{L^\infty(B_1)} \leq \|\varphi\|_{L^\infty(\partial B_1)}$, we conclude the proof. 

With $\Phi_t$ and $X_\varphi$ as above, we now set $\Omega_t = \Phi_t(B_1)$ and
\[ e(t) := E(\Omega_t) = -\frac{1}{2} \int_{\Omega_t} |\nabla u_t|^2 \, dx, \]
where $u_t = u_{\Omega_t}$ is the energy function of $\Omega_t$, i.e.
\begin{equation}
\begin{cases}
-\Delta u_t = 1 & \text{in } \Omega_t, \\
\quad u_t = 0 & \text{on } \partial \Omega_t.
\end{cases}
\end{equation}
We want to compute $e'(t)$ and $e''(t)$. For this we recall that the map $t \mapsto u_t$ is differentiable, see for instance [25, Theorem 5.3.1], and that its derivative $\dot{u}_t$ satisfies
\begin{equation}
\begin{cases}
-\Delta \dot{u}_t = 0 & \text{in } \Omega_t, \\
\quad \dot{u}_t = -\nabla u_t \cdot X_\varphi & \text{on } \partial \Omega_t.
\end{cases}
\end{equation}
Recalling Hadamard formula (see [25, Section 5.2]), for every $f$ sufficiently smooth
\[ \frac{d}{dt} \int_{\Omega_t} f(t, x) \, dx = \int_{\Omega_t} \partial_t f(t, x) \, dx + \int_{\partial \Omega_t} f(t, x) (X_\varphi \cdot \nu_{\Omega_t}) \, d\mathcal{H}^{N-1}, \]
we can now compute (dropping the subscript $\varphi$ for notational simplicity)
\begin{equation}
\begin{aligned}
e'(t) &= -\int_{\Omega_t} \nabla u_t \cdot \nabla \dot{u}_t \, dx - \frac{1}{2} \int_{\partial \Omega_t} |\nabla u_t|^2 (X \cdot \nu_{\Omega_t}) \, d\mathcal{H}^{N-1} \\
&= -\frac{1}{2} \int_{\partial \Omega_t} |\nabla u_t|^2 (X \cdot \nu_{\Omega_t}) \, d\mathcal{H}^{N-1} = -\frac{1}{2} \int_{\Omega_t} \text{div} \left( |\nabla u_t|^2 X \right) \, dx,
\end{aligned}
\end{equation}
where we have used that since $\dot{u}_t$ is harmonic and $u_t \in W^{1,2}_0(\Omega_t)$, their gradient are $L^2$ orthogonal. Differentiating again, using Hadamard formula and that $X$ is autonomous we get
\begin{equation}
\begin{aligned}
e''(t) &= -\int_{\partial \Omega_t} (\nabla u_t \cdot \nabla \dot{u}_t) (X \cdot \nu_{\Omega_t}) \, d\mathcal{H}^{N-1} - \frac{1}{2} \int_{\partial \Omega_t} \text{div} \left( |\nabla u_t|^2 X \right) (X \cdot \nu_{\Omega_t}) \, d\mathcal{H}^{N-1}.
\end{aligned}
\end{equation}
Since $u_t$ is positive and vanishes on $\partial \Omega_t$, 

(A.9) \quad \nabla u_t = -|\nabla u_t| \nu_{\Omega_t} \quad \text{on} \quad \partial \Omega_t,

hence

\[ \nabla u_t \cdot \nabla \dot{u}_t = -|\nabla u_t| \cdot (\nabla^2 u_t \cdot \nu_{\Omega_t}). \]

Moreover, by (A.6) and (A.9), $\dot{u}_t = |\nabla u_t|(X \cdot \nu_{\Omega_t})$, so that equation (A.8) becomes

(A.10) \quad e''(t) = \int_{\partial \Omega_t} \dot{u}_t \partial \nu \dot{u}_t \, d\mathcal{H}^{N-1} - \int_{\partial \Omega_t} (X \cdot \nu_{\Omega_t})(\nabla^2 u_t|\nabla u_t| \cdot X) \, d\mathcal{H}^{N-1} - \frac{1}{2} \int_{\partial \Omega_t} |\nabla u_t|^2 \text{div}(X)(X \cdot \nu_{\Omega_t}) \\
= \int_{\partial \Omega_t} \dot{u}_t \partial \nu \dot{u}_t \, d\mathcal{H}^{N-1} - \int_{\partial \Omega_t} (X \cdot \nu_{\Omega_t})(\nabla^2 u_t|\nabla u_t| \cdot X) \, d\mathcal{H}^{N-1},

where $\partial \nu \dot{u}_t = \nabla \dot{u}_t \cdot \nu_{\Omega_t}$ is the normal derivative of $\dot{u}_t$ and we have used that $\text{div} X = 0$ in a neighborhood of $\partial B_1$ (where $\partial \Omega_t$ is contained). Since on $\partial \Omega_t = \{u_t = 0\}$ we have

\[ -1 = \Delta u_t = -|\nabla u_t| \mathcal{H}_{\partial \Omega_t} + \nabla^2 u_t|\nu_{\partial \Omega_t}| \cdot \nu_{\partial \Omega_t} \]

where $\mathcal{H}_{\partial \Omega_t}$ is the mean curvature of $\partial \Omega_t$ computed with respect to the exterior normal. Hence, we finally get, taking also into account (A.9) and defining $X^r = X - (X \cdot \nu) \nu$ the tangential component of $X$,

(A.11) \quad e''(t) = \int_{\partial \Omega_t} \dot{u}_t \partial \nu \dot{u}_t \, d\mathcal{H}^{N-1} + \int_{\partial \Omega_t} |\nabla u_t|(X \cdot \nu_{\Omega_t})^2 (\nabla^2 u_t|\nu_{\partial \Omega_t}| \cdot \nu_{\partial \Omega_t}) \, d\mathcal{H}^{N-1} \\
- \int_{\partial \Omega_t} (X \cdot \nu_{\Omega_t})(\nabla^2 u_t|\nabla u_t| \cdot X^r) \, d\mathcal{H}^{N-1} \\
= \int_{\Omega} |\nabla u_t|^2 \, dx - \int_{\partial \Omega_t} (X \cdot \nu_{\Omega_t})^2 |\nabla u_t| \, d\mathcal{H}^{N-1} + \int_{\partial \Omega_t} (X \cdot \nu_{\Omega_t})^2 |\nabla u_t|^2 \mathcal{H}_{\partial \Omega_t} \, d\mathcal{H}^{N-1} \\
- \int_{\partial \Omega_t} (X \cdot \nu_{\Omega_t})(\nabla^2 u_t|\nabla u_t| \cdot X^r) \, d\mathcal{H}^{N-1}.

Notice that in the last equality we have used Green formula in the first term (recall the $\dot{u}_t$ is harmonic). We now observe that $\mathcal{H}_{\partial B_1} = (N - 1)$, $X^r = 0$ on $\partial B_1$,

\[ u_0 = u_{B_1} = \frac{1 - |x|^2}{2N} \quad \text{in} \quad B_1, \]

and that $^8 \dot{u}_0 = H(X \cdot \nabla u_0)$. By using these facts in equation (A.11) at $t = 0$, we get

(A.12) \quad e''(0) = \int_{B_1} |\nabla H(X \cdot \nabla u_0)|^2 \, dx + \int_{\partial B_1} \left[ (N - 1) |\nabla u_0| - 1 \right] |\nabla u_0|(X \cdot \nu_{B_1})^2 \, d\mathcal{H}^{N-1} \\
= \frac{1}{N^2} \left( \int_{B_1} |\nabla H(X \cdot \nu_{B_1})|^2 \, dx - \int_{B_1} (X \cdot \nu_{B_1})^2 \, d\mathcal{H}^{N-1} \right).

Lemma A.2. Let $\gamma \in (0, 1]$, there exist $\delta_5 = \delta_5(N, \gamma)$ and a modulus of continuity $\widetilde{\omega}$ such that if $\Omega, \varphi, X_\varphi$ and $\Phi_t$ are as in Lemma A.1 and $\|\varphi\|_{C^{2,\gamma}} \leq \delta_5$, then

(A.13) \quad |e''(t) - e''(0)| \leq \widetilde{\omega}(\|\varphi\|_{C^{2,\gamma}}) \|X_\varphi \cdot \nu_{B_1}\|^2_{H^{1/2}(\partial B_1)}.

---

$^8$Here we are using the notations of Definition 3.2
Proof. We start from \((A.11)\) and pull it back on \(B_1\) through \(\Phi_t\):

\[
\psi''(t) = \int_{B_1} \left| \nabla \hat{u}_t \right|^2 \circ \Phi_t \det \nabla \Phi_t \, dx
\]

\[
- \int_{\partial B_1} \{(X \cdot \nu_{X})^2 |\nabla u_t|^2 - (X \cdot \nu_{X})^2 |\nabla \hat{u}_t|^2 \} \circ \Phi_t \, J^{\partial B_1} \Phi_t \, dH^{N-1}
\]

\[
- \int_{\partial B_1} \{(X \cdot \nu_{X})(\nabla^2 u_t [\nabla u_t] \cdot X^r)\} \circ \Phi_t \, J^{\partial B_1} \Phi_t \, dH^{N-1}
\]

\[
:= I_1(t) + I_2(t) + I_3(t),
\]

where \(J^{\partial B_1} \Phi_t\) is the tangential Jacobian of \(\Phi_t\) (see \([29, \text{Section 11.1}]\)) and we have dropped the subscript \(\varphi\) for notational simplicity. By \((A.1)\) we get

\[
\|\nabla_{\Omega, x} \circ \Phi_t - \nabla_{\partial B_1}\|_{L^\infty(\partial B_1)} + \|J^{\partial B_1} \Phi_t - 1\|_{L^\infty(\partial B_1)} + \|\det \nabla \Phi_t - 1\|_{L^\infty(B_1)} \leq \omega(\|\varphi\|_{C^2, \gamma}).
\]

where here and in the following \(\omega\) will just denote a modulus of continuity whose precise expression will change line by line. Moreover pulling back to \(B_1\) the equation satisfied by \(u_t\), i.e. considering the equation satisfied by \(u_t \circ \Phi_t\) on \(B_1\), Schauder estimates give

\[
\|u - u_t \circ \Phi_t\|_{C^2, \gamma(B_1)} \leq \omega(\|\varphi\|_{C^2, \gamma}).
\]

By Lemma \(A.1\) (i), \(X\) is parallel to \(\theta = x/|x|\) in neighborhood of \(\partial B_1\), hence

\[
\|\nabla_{X, \nu_{X}} \circ \Phi_t - X \cdot \nu_{B_1}\|_{L^\infty(\partial B_1)} \leq \omega(\|\varphi\|_{C^2, \gamma}) |X \cdot \nu_{B_1}|.
\]

where in the last inequality we have used \((A.3)\). With the same computations we also get,

\[
|X^r \circ \Phi_t| \leq \omega(\|\varphi\|_{C^2, \gamma}) |X \cdot \nu_{B_1}|.
\]

By \((A.15)-(A.18)\) we deduce

\[
\|I_2(t) - I_2(0)| + |I_3(t)| \leq \omega(\|\varphi\|_{C^2, \gamma}) \|X \cdot \nu_{B_1}\|_{L^2(\partial B_1)}^2.
\]

Since \(I_3(0) = 0\), we are left to estimate \(I_1(t) - I_1(0)\). Defining \(v_t = \hat{u}_t \circ \Phi_t\) we have \(\nabla v_t = (\nabla \Phi_t)^T \nabla \hat{u}_t \circ \Phi_t\), where \(M^T\) denotes the transposition of a matrix \(M\). Hence, taking into account \((A.1)\) and \((A.15)\), it is an easy computation to see that the proof of the Lemma will be concluded once we have shown that

\[
\left| \int_{B_1} |\nabla v_t|^2 - |\nabla \hat{u}_0|^2 \, dx \right| \leq \omega(\|\varphi\|_{C^2, \gamma}) \|X \cdot \nu_{B_1}\|_{H^{1/2}(\partial B_1)}^2.
\]

Now, from \((A.6)\), we see that \(v_t\) solves the linear elliptic problem

\[
\begin{cases}
\text{div}(M_t \nabla v_t) = 0 & \text{in } B_1, \\
v_t = - (\nabla u_t \cdot X) \circ \Phi_t & \text{on } \partial B_1,
\end{cases}
\]

where \(M_t\) is the symmetric positive definite matrix given by

\[
M_t = \det \nabla \Phi_t ((\nabla \Phi_t)^{-1})^T (\nabla \Phi_t)^{-1}.
\]

Hence, classical elliptic estimates together with \((A.1)\) give

\[
\|\nabla v_t - \nabla \hat{u}_0\|_{L^2(B_1)} \leq C(N) \left( \|M_t - \text{Id}\|_{L^2(B_1)} + \|(\nabla u_t \cdot X) \circ \Phi_t - \nabla \hat{u}_0 \cdot X\|_{H^{1/2}(\partial B_1)} \right)
\]

\[
\leq \omega(\|\varphi\|_{C^2, \gamma}) \|\nabla v_t\|_{L^2(B_1)} + C(N) \|(\nabla u_t \cdot X) \circ \Phi_t - \nabla \hat{u}_0 \cdot X\|_{H^{1/2}(\partial B_1)}.
\]
Since equation (3.4) follows by (A.2), (A.25) and (A.13).

Equations (A.21) and (A.22) imply

\[
\begin{aligned}
\omega & \left( \frac{\| \nabla u_t \|_{L^2(B_1)} }{\| \nabla (X \cdot \theta) \|_{H^{1/2}(\partial B_1)} } \right) \\
& \leq \omega \left( \left\| \nabla u_t \right\|_{L^2(B_1)} + \left\| \nabla u_0 \cdot X \right\|_{H^{1/2}(\partial B_1)} \right).
\end{aligned}
\]

Equations (A.21) and (A.22) imply

\[
\begin{aligned}
\| \nabla u_t - \nabla \hat{u}_0 \|_{L^2(B_1)} & \leq \omega \left( \| \nabla u_t \|_{L^2(B_1)} + \| \nabla (X \cdot \theta) \|_{H^{1/2}(\partial B_1)} \right) \\
& \leq \omega \left( \| \nabla u_t - \nabla \hat{u}_0 \|_{L^2(B_1)} + \| \nabla \hat{u}_0 \|_{L^2(B_1)} + \| \nabla u_0 \cdot X \|_{H^{1/2}(\partial B_1)} \right) \\
& \leq \omega \left( \| \nabla u_t - \nabla \hat{u}_0 \|_{L^2(B_1)} + 2 \| \nabla u_0 \cdot X \|_{H^{1/2}(\partial B_1)} \right),
\end{aligned}
\]

where in the last inequality we have used Definition 3.2, since \( \hat{u}_0 = -H(\nabla u_0 \cdot X) \). Choosing \( \delta_5 \) so that \( \omega(\| \varphi \|_{C^{2,\gamma}}) \leq 1/2 \), we finally get

\[
\| \nabla u_t - \nabla \hat{u}_0 \|_{L^2(B_1)} \leq 4 \omega(\| \varphi \|_{C^{2,\gamma}}) \| \nabla u_0 \cdot X \|_{H^{1/2}(\partial B_1)}.
\]

Since, clearly

\[
\begin{aligned}
\left| \int_{B_1} |\nabla u_t|^2 - |\nabla \hat{u}_0|^2 \, dx \right| & \leq \| \nabla u_t - \nabla \hat{u}_0 \|_{L^2(B_1)} \| \nabla u_t + \nabla \hat{u}_0 \|_{L^2(B_1)} \\
& \leq 2 \| \nabla \hat{u}_0 \|_{L^2(B_1)} \| \nabla u_t - \nabla \hat{u}_0 \|_{L^2(B_1)} + \| \nabla u_t - \nabla \hat{u}_0 \|_{L^2(B_1)}^2,
\end{aligned}
\]
equation (A.20) follows from (A.24) and our definition of \( H^{1/2} \) norm.

We can now prove Lemma 3.4.

**Proof of Lemma 3.4.** By Taylor formula,

\[
E(\Omega) = E(B_1) + e'(0) + \frac{1}{2} e''(0) + \int_0^1 (1 - s) \left( e''(s) - e(0) \right) \, ds.
\]

Since \( |\Omega_t| = |B_1| \), by the Saint-Venant inequality we have \( e'(0) = 0 \). Equation (A.12) gives

\[
e''(0) = \frac{1}{N^2} \left( \int_{B_1} |\nabla H(X \cdot \nu_{B_1})|^2 \, dx - \int_{B_1} (X \cdot \nu_{B_1})^2 \, dH^{N-1} \right) = \partial^2 E(B_1) [X \cdot \nu_{B_1}, X \cdot \nu_{B_1}].
\]

Since,

\[
\left| \partial^2 E(B_1) [X \cdot \nu_{B_1}, X \cdot \nu_{B_1}] - \partial^2 E(B_1) [\varphi, \varphi] \right| \leq \| X \cdot \nu_{B_1} - \varphi \|_{H^{1/2}(\partial B_1)} \| X \cdot \nu_{B_1} + \varphi \|_{H^{1/2}(\partial B_1)},
\]
equation (3.4) follows by (A.2), (A.25) and (A.13).
Acknowledgements. It is a pleasure to acknowledge Marco Barchiesi, Nicola Fusco and Aldo Pratelli for some useful discussions at a preliminary stage of this work. We also thank Jimmy Lamboley for pointing out to us paper [16]. Nikolai Nadirashvili kindly provided us a copy of [23] and [32], we wish to warmly thank him. A visit of the second author to Marseille has been the occasion to fix some final details: the LATP institution and its facilities are kindly acknowledged.
